An Introduction to R for Spatial Analysis and Mapping Chris Brunsdon, Lex Comber, 2025-04-18 The ever expanding availability of spatial data continues to revolutionise research This book is your go to guide to getting the most out of handling mapping and analysing location based data Without assuming prior knowledge of GIS geocomputation or R this book helps you understand spatial analysis and mapping and develop your programming skills from learning about scripting and writing functions to point pattern analysis and spatial attribute analysis The book illustrates approaches to analysis on a range of datasets that are new to this edition Enables you to put your skills into practice with embedded exercises and over 30 self test questions Showcases the possibilities of using spatial analysis to explore spatial inequalities Whether you're a novice or experienced user this book equips upper undergraduates postgraduates and researchers with the tools needed for spatial data handling and rich analysis

Geographical Data Science and Spatial Data Analysis Lex Comber, Chris Brunsdon, 2020-12-02 We are in an age of big data where all of our everyday interactions and transactions generate data Much of this data is spatial it is collected somewhere and identifying analytical insight from trends and patterns in these increasing rich digital footprints presents a number of challenges Whilst other books describe different flavours of Data Analytics in R and other programming languages there are none that consider Spatial Data i.e. the location attached to data or that consider issues of inference linking Big Data Geography GIS Mapping and Spatial Analytics This is a learning by doing textbook building on the previous book by the same authors *An Introduction to R for Spatial Analysis and Mapping* It details the theoretical issues in analyses of Big Spatial Data and developing practical skills in the reader for addressing these with confidence

The Least Cost Path From Landscape Genetics to Landscape Genomics Samuel A. Cushman, Andrew J. Shirk, Glenn T. Howe, Melanie A. Murphy, Rodney J. Dyer, Stéphane Joost, 2018-08-03 Ecosystems are the stage on which the play of evolution is acted and ecosystems are complex spatially structured and temporally varying The purpose of this Research Topic is to explore critical challenges and opportunities for the transition from landscape genetics to landscape genomics Landscape genetics has focused on the spatial analysis of small genetic datasets typically comprised of less than 20 microsatellite markers taken from clusters of individuals in putative populations or distributed individuals across landscapes The recent emergence of large scale genomic datasets produced by next generation sequencing methods poses tremendous challenge and opportunity to the field Perhaps the greatest is to produce process curate archive and analyze spatially referenced genomic datasets in a way such that research is led by a priori hypotheses regarding how environmental heterogeneity and temporal dynamics interact to affect gene flow and selection The papers in the Research Topic cover a broad range of topics under this area of focus from reviews of the emergence of landscape genetics to best practices in spatial analysis of genetic data The compilation like the emerging field itself is eclectic and illustrates the scope of both the challenges and opportunities of this emerging field

Bayesian Hierarchical Models Peter D. Congdon, 2019-09-16 An

intermediate level treatment of Bayesian hierarchical models and their applications this book demonstrates the advantages of a Bayesian approach to data sets involving inferences for collections of related units or variables and in methods where parameters can be treated as random collections Through illustrative data analysis and attention to statistical computing this book facilitates practical implementation of Bayesian hierarchical methods The new edition is a revision of the book *Applied Bayesian Hierarchical Methods* It maintains a focus on applied modelling and data analysis but now using entirely R based Bayesian computing options It has been updated with a new chapter on regression for causal effects and one on computing options and strategies This latter chapter is particularly important due to recent advances in Bayesian computing and estimation including the development of rjags and rstan It also features updates throughout with new examples The examples exploit and illustrate the broader advantages of the R computing environment while allowing readers to explore alternative likelihood assumptions regression structures and assumptions on prior densities Features Provides a comprehensive and accessible overview of applied Bayesian hierarchical modelling Includes many real data examples to illustrate different modelling topics R code based on rjags jagsUI R2OpenBUGS and rstan is integrated into the book emphasizing implementation Software options and coding principles are introduced in new chapter on computing Programs and data sets available on the book s website
