Immunological Bioinformatics Ole Lund, Morten Nielsen, Claus Lundegaard, Can Kesmir, Søren Brunak, 2024-02-06 Using bioinformatics methods to generate a systems level view of the immune system description of the main biological concepts and the new data driven algorithms Despite the fact that advanced bioinformatics methodologies have not been used as extensively in immunology as in other subdisciplines within biology research in immunological bioinformatics has already developed models of components of the immune system that can be combined and that may help develop therapies vaccines and diagnostic tools for such diseases as AIDS malaria and cancer In a broader perspective specialized bioinformatics methods in immunology make possible for the first time a systems level understanding of the immune system The traditional approaches to immunology are reductionist avoiding complexity but providing detailed knowledge of a single event cell or molecular entity Today a variety of experimental bioinformatics techniques connected to the sequencing of the human genome provides a sound scientific basis for a comprehensive description of the complex immunological processes This book offers a description of bioinformatics techniques as they are applied to immunology including a succinct account of the main biological concepts for students and researchers with backgrounds in mathematics statistics and computer science as well as explanations of the new data driven algorithms in the context of biological data that will be useful for immunologists biologists and biochemists working on vaccine design In each chapter the authors show interesting biological insights gained from the bioinformatics approach The book concludes by explaining how all the methods presented in the book can be integrated to identify immunogenic regions in microorganisms and host genomes

Algorithms in Structural Molecular Biology Bruce R. Donald, 2011-06-01 An overview of algorithms important to computational structural biology that addresses such topics as NMR and design and analysis of proteins Using the tools of information technology to understand the molecular machinery of the cell offers both challenges and opportunities to computational scientists Over the past decade novel algorithms have been developed both for analyzing biological data and for synthetic biology problems such as protein engineering This book explains the algorithmic foundations and computational approaches underlying areas of structural biology including NMR nuclear magnetic resonance X ray crystallography and the design and analysis of proteins peptides and small molecules Each chapter offers a concise overview of important concepts focusing on a key topic in the field Four chapters offer a short course in algorithmic and computational

issues related to NMR structural biology giving the reader a useful toolkit with which to approach the fascinating yet thorny computational problems in this area. A recurrent theme is understanding the interplay between biophysical experiments and computational algorithms. The text emphasizes the mathematical foundations of structural biology while maintaining a balance between algorithms and a nuanced understanding of experimental data. Three emerging areas particularly fertile ground for research students are highlighted: NMR methodology, design of proteins and other molecules, and the modeling of protein flexibility. The next generation of computational structural biologists will need training in geometric algorithms, provably good approximation algorithms, scientific computation, and an array of techniques for handling noise and uncertainty in combinatorial geometry and computational biophysics. This book is an essential guide for young scientists on their way to research success in this exciting field.
