ripple tank experiment sf scientific - Feb 15 2022

web mar 7 2016 1. The purpose of this experiment is to investigate the relationship between the frequency of the waves and the wavelength of the waves in a ripple tank. The apparatus consists of a ripple tank, a motor, a vibrator, a lamp, a screen, and a ruler. The motor is connected to the vibrator and the lamp is connected to the screen. The vibrator is used to create waves in the water. The lamp is used to illuminate the waves. The screen is used to observe the waves. The ruler is used to measure the wavelength of the waves. The frequency of the waves is measured by counting the number of waves that pass a point in a given time. The wavelength of the waves is measured by measuring the distance between two consecutive wave crests. The relationship between the frequency and the wavelength is investigated by plotting a graph of frequency against wavelength. The graph shows that the frequency of the waves is inversely proportional to the wavelength of the waves. This is consistent with the wave equation $v = f\lambda$, where v is the speed of the waves, f is the frequency, and λ is the wavelength. The speed of the waves is measured by measuring the time taken for a wave crest to travel a known distance. The speed of the waves is found to be approximately 18 cm/s.
