Advances in Network and Acoustic Echo Cancellation J. Benesty, T. Gänslér, D.R. Morgan, M.M. Sondhi, S.L.

Gay, 2013-04-17 For many decades hybrid devices have been used to connect 2 wire local circuits and 4 wire long distance circuits in telephone lines This leads to a well known problem whereby echoes are generated The delay introduced by telecommunication satellites exacerbated this problem and the need for new methods of echo control soon became obvious The best solution to date for solving this problem was invented in the 1960s at Bell Labs by Kelly Logan and Sondhi and consists of identifying the echo path generated by the hybrid by means of an adaptive filter a technique that became known as an echo canceler The echo canceler allowed full duplex communication which was not possible with older echo suppression techniques Later with the development of hands free teleconferencing systems an other echo problem appeared but this time the echo was due to the coupling between the loudspeaker and microphone It is not surprising that the same solution was proposed to solve this problem and most of today's teleconferencing systems have an acoustic echo canceler More recently attention has been given to the very interesting problem of multichannel acoustic echo cancellation which leads to more exciting applications that take advantage of our binaural auditory system **Adaptive Signal Processing**

Jacob Benesty, Yiteng Huang, 2013-03-09 By adaptive signal processing we mean in general adaptive filtering In known environments where we need to model identify or track time varying channels adaptive filtering has been proven to be an effective and powerful tool As a result this tool is now in use in many different fields Since the invention by Widrow and Ho in 1959 of one of the first adaptive filters the so called least mean square many applications appeared to have the potential to use this fundamental concept While the number of applications using adaptive algorithms has been and keeps flourishing with time thanks to several successes the need for more sophisticated adaptive algorithms became obvious as real world problems are more complex and more demanding Even though the theory of adaptive filtering is already a well established topic in signal processing new and improved concepts are discovered every year by researchers Some of these recent approaches are discussed in this book The goal of this book is to provide for the first time a reference to the hottest real world applications where adaptive filtering techniques play an important role To do so we invited top researchers in different fields to contribute chapters addressing their specific topic of study Thousands of pages would probably not be enough to describe all the practical applications utilizing adaptive algorithms Therefore we limited the topics to some important applications in acoustics speech wireless and networking where research is still very active and open *Advances in Digital Speech Transmission*
