Bell, 2003 From the contents Initial planning for urban transit systems S C Wirasinghe Public transport timetabling and vehicle scheduling A Ceder Designing public transport network and routes A Ceder Transit path choice and assignment model approaches A Nuzzolo Schedule based transit assignment models A Nuzzolo Frequency based transit route choice models M Florian

Schedule-Based Dynamic Transit Modeling Nigel H. M. Wilson, Agostino Nuzzolo, 2013-03-09 Schedule Based Dynamic Transit Modeling Theory and Applications outlines the new schedule based dynamic approach to mass transit modeling In the last ten years the schedule based dynamic approach has been developed and applied especially for operational planning It allows time evolution of on board loads and travel times for each run of each line to be obtained and uses behavioral hypotheses strictly related to transit systems and user characteristics It allows us to open new frontiers in transit modelling to support network design timetable setting investigation of congestion effects as well as the assessment of new technologies introduction such as information to users ITS technologies The contributors and editors of the book are leading researchers in the field of transportation and in this volume they build a solid foundation for developing still more sophisticated models These future models of mass transit systems will continue to add higher levels of accuracy and sensitivity desired in forecasting the performance of public transport systems

Modelling Intelligent Multi-Modal Transit Systems Agostino Nuzzolo, William H. K. Lam, 2017-02-17 The growing mobility needs of travellers have led to the development of increasingly complex and integrated multi modal

transit networks Hence transport agencies and transit operators are now more urgently required to assist in the challenging task of effectively and efficiently planning managing and governing transit networks A pre condition for the development of an effective intelligent multi modal transit system is the integration of information and communication technology ICT tools that will support the needs of transit operators and travellers To achieve this reliable real time simulation and short term forecasting of passenger demand and service network conditions are required to provide both real time traveller information and successfully synchronise transit service planning and operations control Modelling Intelligent Multi Modal Transit Systems introduces the current trends in this newly emerging area Recent developments in information technology and telematics have enabled a large amount of data to become available thus further attracting transport researchers to set up new models outside the context of the traditional data driven approach The alternative demand supply interaction or network assignment modelling approach has improved greatly in recent years and has a crucial role to play in this new context

Schedule-Based Modeling of Transportation Networks Nigel H. M. Wilson, Agostino Nuzzolo, 2008-10-22 Schedule Based Modeling of Transportation Networks Theory and Applications follows the book Schedule Based Dynamic Transit Modeling published in this series in 2004 recognizing the critical role that schedules play in transportation systems Conceived for the simulation of transit systems in the last few years the schedule based approach has been expanded and applied to operational planning of other transportation schedule services besides mass transit e g freight transport This innovative approach allows forecasting the evolution over time of the on board loads on the services and their time varying performance using credible user behavioral hypotheses It opens new frontiers in transportation modeling to support network design timetable setting and investigation of congestion effects as well as the assessment of such new technologies such as users system information ITS technologies *Public Transport Planning with Smart Card Data* Fumitaka Kurauchi, Jan-Dirk Schmöcker, 2017-02-17 Collecting fares through smart cards is becoming standard in most advanced public transport networks of major cities around the world Travellers value their convenience and operators the reduced money handling fees Electronic tickets also make it easier to integrate fare systems to create complex time and space differentiated fare systems and to provide incentives to specific target groups A less utilised benefit is the data collected through smart cards Records even if anonymous provide for a much better understanding of passengers travel behaviour as current literature shows This information can also be used for better service planning Public Transport Planning with Smart Card Data handles three major topics how passenger behaviour can be estimated using smart card data how smart card data can be combined with other trip databases and how the public transport service level can be better evaluated if smart card data is available The book discusses theory as well as applications from cities around the world and will be of interest to researchers and practitioners alike who are interested in the state of the art as well as future perspectives that smart card data will bring

Handbook of Research Methods and Applications in Transport Economics and Policy Chris Nash, 2015-09-25 Transport economics and policy analysis is a field which has seen major advances in methodology in recent decades covering issues such as estimating cost functions modelling of demand dealing with externalities examining industry ownership and structure pricing and investment decisions and measuring economic impacts This Handbook contains reviews of all these methods with an emphasis on practical applications commissioned from an international cast of experts in the field

Hybrid Predictive Control for Dynamic Transport Problems Alfredo Nunez, Doris Saez, Cristián E. Cortés, 2012-10-03 Hybrid Predictive Control for Dynamic Transport Problems develops methods for the design of predictive control strategies for nonlinear dynamic hybrid discrete continuous variable systems The methodology is designed for real time applications particularly the study of dynamic transport systems Operational and service policies are considered as well as cost reduction The control structure is based on a sound definition of the key variables and their evolution A flexible objective function able to capture the predictive behaviour of the system variables is described Coupled with efficient algorithms mainly drawn from area of computational intelligence this is shown to optimize performance indices for real time applications The framework of the proposed predictive control methodology is generic and being able to solve nonlinear mixed integer optimization problems dynamically is readily extendable to other industrial processes The main topics of this book are hybrid predictive control HPC design based on evolutionary multiobjective optimization EMO HPC based on EMO for dial a ride systems and HPC based on EMO for operational decisions in public transport systems Hybrid Predictive Control for Dynamic Transport Problems is a comprehensive analysis of HPC and its application to dynamic transport systems Introductory material on evolutionary algorithms is presented in summary in an appendix The text will be of interest to control and transport engineers working on the operational optimization of transport systems and to academic researchers working with hybrid systems The potential applications of the generic methods presented here to other process fields will make the book of interest to a wider group of researchers scientists and graduate students working in other control related disciplines
