**Advances in Mapping from Remote Sensor Imagery** Xiaojun Yang, Jonathan Li, 2017-10-27 Advances in Mapping from Remote Sensor Imagery Techniques and Applications reviews some of the latest developments in remote sensing and information extraction techniques applicable to topographic and thematic mapping Providing an interdisciplinary perspective leading experts from around the world have contributed chapters examining state of the art techniques as well as widely used methods The book covers a broad range of topics including photogrammetric mapping and LiDAR remote sensing for generating high quality topographic products global digital elevation models current methods for shoreline mapping and the identification and classification of residential buildings Contributors also showcase cutting edge developments for environmental and ecological mapping including assessment of urbanization patterns mapping vegetation cover monitoring invasive species and mapping marine oil spills crucial for monitoring this significant environmental hazard The authors exemplify the information presented in this text with case studies from around the world Examples include Envisat ERS 2 images used to generate digital elevation models over northern Alaska In situ radiometric observations and MERIS images employed to retrieve chlorophyll a concentration in inland waters in Australia ERS 1 2 SAR images utilized to map spatiotemporal deformation in the southwestern United States Aerospace sensors and related information extraction techniques that support various mapping applications have recently garnered more attention due to the advances in remote sensing theories and technologies This book brings together top researchers in the field providing a state of the art review of some of the latest advancements in remote sensing and mapping technologies *GNSS Environmental Sensing* Joseph Awange, 2017-09-04 This book is the second edition of Environmental Monitoring using GNSS and highlights the latest developments in global navigation satellite systems GNSS It features a completely new title and additional chapters that present emerging challenges to environmental monitoring climate variability change and food insecurity Since the publication of the first edition much has changed in both the development and applications of GNSS a satellite microwave remote sensing technique It is the first tool to span all four dimensions of relevance to humans position navigation timing and the environment and it has widely been used for positioning both by military and civilians navigation and timing Its increasing use is leading to a new era of remote sensing that is now revolutionizing the art of monitoring our environment in ways never imagined before On the one hand nearly all GNSS satellites Global Positioning System GPS Global Navigation Satellite System GLONASS Galileo and Beidou have become operational thereby providing high precision continuous all weather and near real time remote sensing multi signals beneficial to environmental monitoring On the other hand the emerging challenges of precisely monitoring climate change and the demand for the production of sufficient food for ever increasing populations are pushing traditional monitoring methods to their limits In this regard refracted GNSS signals i e occulted GNSS signals or GNSS meteorology are now emerging as sensors of climate variability while the reflected signals

GNSS reflectometry or GNSS R are increasingly finding applications in determining e.g. soil moisture content, ice and snow thickness, ocean heights and wind speed and direction among others. Furthermore, the increasing recognition and application of GNSS supported unmanned aircraft vehicles (UAV) drones in agriculture e.g. through the determination of water holding capacity of soil highlights the new challenges facing GNSS. As such, this new edition has three new chapters addressing GNSS reflectometry and applications, GNSS sensing of climate variability and the applications in UAV drones. Moreover, it explores the application of GNSS to support integrated coastal zone management.

Environmental Geoinformatics Joseph Awange, John Kiema, 2018-12-08. This second edition includes updated chapters from the first edition as well as five additional new chapters: Light detection and ranging (LiDAR), CORONA historical declassified products, Unmanned Aircraft Vehicles (UAVs), GNSS reflectometry and GNSS applications to climate variability, shifting the main focus from monitoring and management to extreme hydro-climatic and food security challenges and exploiting big data. Since the publication of the first edition, much has changed in terms of technology and the demand for geospatial data has increased with the advent of the big data era. For instance, the use of laser scanning has advanced so much that it is unavoidable in most environmental monitoring tasks, whereas unmanned aircraft vehicles (UAVs) drones are emerging as efficient tools that address food security issues as well as many other contemporary challenges. Furthermore, global navigation satellite systems (GNSS) are now responding to challenges posed by climate change by unravelling the impacts of teleconnection e.g. ENSO as well as advancing the use of reflected signals (GNSS reflectometry) to monitor e.g. soil moisture variations. Indeed, all these rely on the explosive use of big data in many fields of human endeavour. Moreover, with the ever-increasing global population, intense pressure is being exerted on the Earth's resources, leading to significant changes in its land cover e.g. deforestation, diminishing biodiversity and natural habitats, dwindling fresh water supplies and changing weather and climatic patterns e.g. global warming, changing sea level. Environmental monitoring techniques that provide information on these are under scrutiny from an increasingly environmentally conscious society that demands the efficient delivery of such information at a minimal cost. Environmental changes vary both spatially and temporally, thereby putting pressure on traditional methods of data acquisition, some of which are highly labour intensive such as animal tracking for conservation purposes. With these challenges, conventional monitoring techniques, particularly those that record spatial changes, call for more sophisticated approaches that deliver the necessary information at an affordable cost. One direction being pursued in the development of such techniques involves environmental geoinformatics, which can act as a stand-alone method or complement traditional methods.

Engineering Geology for Society and Territory - Volume 5 Giorgio Lollino, Andrea Manconi, Fausto Guzzetti, Martin Culshaw, Peter Bobrowsky, Fabio Luino, 2014-08-25. This book is one out of 8 IAEG XII Congress volumes and deals with the theme of urban geology. Along with a rapidly growing world population, the wave of urban growth continues, causing cities to swell and new metropolitan centers to emerge. These global trends also open new ventures for underground
