Advances in Thin-Film Solar Cells I M Dharmadasa, 2012-09-17 This book concentrates on the latest developments in our understanding of solid state device physics. The material presented is mainly experimental and based on CdTe thin film solar cells. It extends these new findings to CIGS thin film solar cells and presents a new device design based on graded bandgap multilayer solar cells. This design has been experimentally tested using the well researched GaAs AlGaAs system and initial devices have shown impressive device parameters. These devices are capable of absorbing all radiation UV visible and infra red within the solar spectrum and combines impact ionization and impurity photovoltaic effects. The improved device understanding presented in this book should impact and guide future device design and low cost thin film solar panel manufacture.
