Application of Toxicogenomics to Cross-Species Extrapolation National Research Council, Division on Earth and Life Studies, Board on Life Sciences, Board on Environmental Studies and Toxicology, Committee on Emerging Issues and Data on Environmental Contaminants, Committee on Applications of Toxicogenomics to Cross-Species Extrapolation, 2006-05-24 Some of what we know about the health effects of exposure to chemicals from food drugs and the environment come from studies of occupational inadvertent or accident related exposures When there is not enough human data scientists rely on animal data to assess risk from chemical exposure and make health and safety decisions However humans and animals can respond differently to chemicals including the types of adverse effects experienced and the dosages at which they occur Scientists in the field of toxicogenomics are using new technologies to study the effects of chemicals For example in response to a particular chemical exposure they can study gene expression transcriptomics proteins proteomics and metabolites metabolomics and they can also look at how individual and species differences in the underlying DNA sequence itself can result in different responses to the environment Based on a workshop held in August 2004 this report explores how toxicogenomics could enhance scientists ability to make connections between data from experimental animal studies and human health
