Aviation Information

Management Barbara G. Kanki,2017-03-02 Operational information management is at a crossroads as it sheds the remaining vestiges of its paper based processes and moves through the uncharted domain of electronic data processes The final outcome is not yet in full focus but real progress has been made in the transition to electronic documents providing the aviation industry with a clear direction This book looks at a combination of industry initiatives and airline successes that point to the next steps that operators can take as they transition to fully integrated information management systems Although the route has not been fully identified it is evident that a key to successful long term efficient information management is industry wide cooperation The chapters are authored by a range of experts in operational information management and collectively they outline ways that operators can improve efficiency across flight ground and maintenance operations Considerations and recommendations are identified and presented addressing the following priorities Safety critical information and procedures Human factors Information security Operational information standardization The readership includes Airline flight operations managers and standards personnel Airline operating documents and publication specialists Airline information managers Commercial pilots Airline maintenance managers and personnel Manufacturers and vendors of aviation products Aviation regulators and policy makers Aviation researchers and developers of information technologies and Military technical publications specialists

Aviation Automation

Charles E. Billings,2018-01-29 The advent of very compact very powerful digital computers has made it possible to automate a great many processes that formerly required large complex machinery Digital computers have made possible revolutionary changes in industry commerce and transportation This book an expansion and revision of the author s earlier technical papers on this subject describes the development of automation in aircraft and in the aviation system its likely evolution in the future and the effects that these technologies have had and will have on the human operators and managers of the system It suggests concepts that may be able to enhance human machine relationships in future systems The author focuses on the ability of human operators to work cooperatively with the constellation of machines they command and control because it is the interactions among these system elements that result in the system s success or failure whether in aviation or elsewhere Aviation automation has provided great social and technological benefits but these benefits have not come without cost In recent years new problems in aircraft have emerged due to failures in the human machine relationship These incidents and

accidents have motivated this inquiry into aviation automation. Similar problems in the air traffic management system are predicted as it becomes more fully automated. In particular, incidents and accidents have occurred which suggest that the principle problems with today's aviation automation are associated with its complexity, coupling, autonomy, and opacity. These problems are not unique to aviation; they exist in other highly dynamic domains as well. The author suggests that a different approach to automation called human-centered automation offers potential benefits for system performance by enabling a more cooperative human-machine relationship in the control and management of aircraft and air traffic.

AIR CRASH INVESTIGATIONS: MIRACLE ON THE HUDSON RIVER
The Ditching of US Airways Flight 1549
Pete Collins, Editor, 2014-04-22

On January 15, 2009, about 1527 eastern standard time, US Airways flight 1549, an Airbus Industrie A320-214 N106US, experienced an almost complete loss of thrust in both engines after encountering a flock of birds and was subsequently ditched on the Hudson River about 8.5 miles from LaGuardia Airport (LGA), New York City, New York. The flight was en route to Charlotte Douglas International Airport, Charlotte, North Carolina, and had departed LGA about 2 minutes before the in-flight event occurred. The 150 passengers and 5 crewmembers evacuated the airplane via the forward and overwing exits. One flight attendant and four passengers were seriously injured, and the airplane was substantially damaged beyond repair. The National Transportation Safety Board determines that the probable cause of this accident was the ingestion of large birds into each engine, which resulted in an almost total loss of thrust in both engines and the subsequent ditching on the Hudson River.
