- (6) Differential Pinion Shaft
- (7) Differential Case
- (8) Differential Lock Clutch
- (9) Differential Gear Shaft

When resistance to the right and left tires are greatly different due to ground conditions or type of work, the tire with less resistance slips and prevents the tractor from moving ahead. To compensate for this drawback, the differential lock restricts the differential action and causes both rear axles to rotate as a unit.

When the differential lock pedal is stepped on, it causes the differential lock lever (3) to rotate, which will move the shift fork (2) and the differential lock

clutch (8) toward the spiral bevel gear (5). The differential lock clutch (8) engaged with the teeth of the differential case (7) to cause the differential case (7) and the differential lock clutch (8) to rotate as a unit.

Therefore, differential pinions (1) are unable to rotate around differential pinion shaft (6) and identical revolutions are transmitted to the right and left differential gear shafts (4), (9).
