BIOMES

Take a closer look at the images above. Each is home to a variety of plants and animals, but no two are the same. Although they're all capable to life, there are quite a lot of differences too. Many of these differences are **abiotic**, or non-living parts of the environment. Abiotic factors include temperature, the amount of oxygen in the air or water, and the kind of soil present.

infer, or make your best guess, about some of the abiotic factors in each of the images.

Location	Temperature	Amount of rainfall
A		
B		
C		

Specifying these locations are all home to many trees, or living, factors as well. What kinds of species do you think live in each of these places? Find five in plants, animals, birds, fish, insects, and even microscopic life like bacteria!

Chaparral

Tundra

Lastly, the **chaparral** biome is a coastal biome with hot, dry summers and mild winters. It has mostly shrubs with a few short trees. Deer, birds, and rabbits live in the chaparral.

Tundra When we think of deserts, we usually think of a hot and dry place, but did you know that deserts can be cold too? The **Tundra** in Alaska is the largest cold desert, but there is so much snow (and) that it's still considered a desert. Both plants and animals must adapt to dry life in the desert. Many develop unique ways of surviving such as water storage.

extremely nutrient rich soil. Here you'll find a variety of plants and animals. Due to their dry and hot climate, plants in both savanna and grasslands are adapted to survive relatively common fires.

Desert When we think of deserts, we usually think of a hot and dry place, but did you know that deserts can be cold too? The **Desert** in Alaska is the largest cold desert, but there is so much snow (and) that it's still considered a desert. Both plants and animals must adapt to dry life in the desert. Many develop unique ways of surviving such as water storage or the ability to remain dormant (similar to hibernation) for a long time.

Forest There are several different kinds of forest biomes, including: The **rainforest** is most likely the most famous forest. This lush biome is home to a vast number of plants and animals. The **temperate forest** is home to a variety of trees and animals. The **coniferous forest** is home to a variety of trees and animals.

The **temperate forest** is common in the US, Canada, Europe, and Asia. Here you'll find a variety of plants and animals. The **coniferous forest** is common in the US, Canada, Europe, and Asia. Earth is an amazing planet. It has many different environments that make perfect homes for millions of species. The largest major habitats that exist worldwide are known as **biomes**. Most likely, you're familiar with many of these: desert, rainforest, grassland, etc. Each biome is unique and has its own set of characteristics that make it different from the others. The study of biomes is called **biogeography**, or the amazing variety of life that makes our Earth so abundant in biodiversity.

How many biomes are there? Do all water environments constitute a single aquatic biome? Are all fire-filled ecosystems considered a forest biome? The number of biomes you could simply depend on how specific you'd like to be. Let's take a look at some of the largest biomes, and the abiotic and biotic factors that define them.

Savanna

For fish, birds, frogs, whales, and other aquatic species.

Grassland biomes live up to their name! They're made up of open and very few trees. The two major grassland biomes are the **savanna** and **temperate grassland**.

The **savanna** is a biome that covers half of Africa and large parts of Australia. These areas have a 6-8 month wet season in the summer and a 4-6 month dry season in the winter. Elephants, giraffes, and zebras are common in a savanna.

The **temperate grasslands**, on the other hand, make up the plains of middle America. They're made up of open and very few trees. The two major grassland biomes are the **savanna** and **temperate grassland**.
