Breeding Strategies For Sustainable Forage And Turf Grass Improvement:

Breeding strategies for sustainable forage and turf grass improvement Susanne Barth, Dan Milbourn, 2012-07-25 From the 4th 8th of September 2011 the Eucarpia Fodder Crops and Amenity Grasses Section held its 29th Meeting in the surroundings of Dublin Castle in Ireland The theme of the meeting was Breeding strategies for sustainable forage and turf grass improvement Grasslands cover a significant proportion of the land mass of the world and play a pivotal role in global food production At the same time we are faced with several challenges that affect the way in which we think about this valuable set of resources The population of the world is expected to exceed 9 billion by 2050 and increase of about one third relative to today's levels This population increase will be focused in urban areas and in what are currently viewed as developing countries meaning that the buying power of this increased population will be greater shifting the balance of demand from staple crops to high value items such as meat and dairy products Overall that the world will have to approximately double agricultural output across all categories of food to meet the demands of this larger urbanised population This is occurring against a backdrop of equally large challenges in terms of global climate change Agriculture is already a significant contributor to e.g. greenhouse gas emissions deforestation and soil erosion The situation is made more complex by an increased emphasis on biofuels as a solution for our imminent oil shortage resulting in increased competition between land utilised for food and fuel In short agriculture must continue to feed the world whilst not contributing to damaging it further It must be sustainable Plant breeding plays a significant but frequently understated role in meeting the challenges presented by this complex and changing scenario However plant breeding and improvement is itself undergoing radical change driven by technology This book explores how forage and turf breeding is changing and adapting to meet these challenges using the technological advances being experienced in plant breeding as a whole Quantitative Traits Breeding for Multifunctional Grasslands and Turf Dejan Sokolović, Christian Huyghe, Jasmina Radović, 2014-09-12 Grasslands are among the largest ecosystems in the world and consequently are of great importance to mankind The genotypes of the species which are the main components of the grasslands have great influence on total outcome and successful utilization of grasslands Therefore fodder crops and turf swards should be constantly improved to follow modern trends in agriculture production and landscape architecture The wide range of breeding programs for forage and amenity species as well as new breeding methods and techniques is rapidly expanding the boundaries and is making it possible to achieve outstanding breeding results This book includes papers presented at the 30th EUCARPIA Fodder Crops and Amenity Grasses Section Meeting The challenging title of the book focuses on breeding of quantitative traits which directly impact the profitability and sustainability of grasslands and fodder crops production as well as on multidisciplinary approach in grassland research and utilisation Included papers offer a unique collection of ideas and breakthroughs in the fields of fodder crops and amenity grasses breeding and genetics as well as in the creative and innovative application of new tools in practical breeding
