

Basics of Image Processing in Computer Vision

databasetown.com

1

Digital Images

Digital images are made up of discrete units called pixels arranged in a 2D grid.

2

Filtering

Filtering means to modifying an image by computing a new value for each pixel based on its neighboring pixels.

3

Thresholding

This technique converts a grayscale image into a binary image by setting pixel values above a threshold to white and values below to black.

4

Morphological Operations

These involve applying a structuring element to an image to extract useful shapes and segments.

5

Edge Detection

This detects object boundaries in an image. Algorithms like Canny edge detector are commonly used.
