Constructal Theory of Social Dynamics Adrian Bejan, Gilbert W. Merks, 2007-10-26 Constructal Theory of Social Dynamics brings together for the first time social scientists and engineers who present predictive theory of social organization as a conglomerate of mating flows that morph in time to flow more easily The book offers a new way to look at social phenomena as part of natural phenomena and examines a new domain of application of engineering such as thermodynamic optimization thermoeconomics and design as science

Design with Constructal Theory Adrian Bejan, Sylvie Lorente, 2008-09-09 Design course on the universal principle of configurations in nature and engineering the constructal law Design with Constructal Theory offers a revolutionary new approach based on physics for understanding and predicting the designs that arise in nature and engineering from the tree and the forest to the cooling of electronics urban design decontamination and vascular smart materials This book shows how you can use the method of constructal theory to design human made systems in order to reduce trial and error and increase the system performance First developed in the late 1990s constructal theory holds that flow architecture arises from the natural evolutionary tendency to generate greater flow access in time and in flow configurations that are free to morph It unites flow systems with solid mechanical structures which are viewed as systems for the flow of stresses Constructal theory unites nature with engineering and helps us generate novel designs across the board from high density packages to vascular materials with new functionalities self healing self cooling and from tree shaped heat exchangers to svelte fluid flow and solid structures Design with Constructal Theory starts with basic principles and then shows how these principles are applied to understanding and designing increasingly complex systems Problems and exercises at the end of each chapter give you an opportunity to use constructal theory to solve actual design problems This book is based on a design course developed by the two authors for upper level undergraduates and graduate students at Duke University and other universities all over the world With the authors expert guidance students and professionals in mechanical civil environmental chemical aerospace and biomedical engineering will understand natural systems and then practice design as science by relying on constructal strategies to pursue and discover novel and effective designs

Constructal Human Dynamics, Security and Sustainability Adrian Bejan, 2009 Globalization security infrastructure and energy sustainability can be designed based on a scientific principle In this book these objectives are approached based on constructal theory which means to design such projects as global flow architectures that are alive with movement of personnel equipment information education etc Constructal Human Dynamics Security and Sustainability highlights the progress made during the NATO Advanced Research Workshop held in Vila Real Portugal in May 2008 This workshop brought together social scientists with physicists engineers and biologists Together they addressed main topics such as human dynamics viewed as natural phenomena of design generation flow networks for distribution and collection large scale construction projects e g airports waste storage logistics decontamination energy supply routes distributed

energy systems water resources management environmental security sustainability and globalization The chapters selected for this book represent the interdisciplinary approach and team atmosphere that emerged in vora

Constructal Law and the Unifying Principle of Design Luiz A.O. Rocha, Sylvie Lorente, Adrian Bejan, 2012-12-04 Design happens everywhere whether in animate objects e g dendritic lung structures bacterial colonies and corals inanimate patterns river basins beach slope and dendritic crystals social dynamics pedestrian traffic flows or engineered systems heat dissipation in electronic circuitry This design in nature often takes on remarkably similar patterns which can be explained under one unifying Constructal Law This book explores the unifying power of the Constructal Law and its applications in all domains of design generation and evolution ranging from biology and geophysics to globalization energy sustainability and security The Constructal Law accounts for the universal tendency of flow systems to morph into evolving configurations that provide greater and easier access over time The Constructal Law resolves the many and contradictory ad hoc statements of optimality end design and destiny in nature such as minimum and maximum entropy production and minimum and maximum flow resistance and also explains the designs that are observed and copied in biomimetics Constructal Law and the Unifying Principle of Design covers the fundamentals of Constructal Theory and Design as well as presenting a variety of state of the art applications Experts from the biological physical and social sciences demonstrate the unification of all design phenomena in nature and apply this knowledge to novel designs in modern engineering such as vascularization for self healing and self cooling materials for aircraft and tree fins and cavities for heat transfer enhancement

Heat Transfer Miguel Araiz, 2021-09-22 Thermal energy is present in all aspects of our lives including when cooking driving or turning on the heat or air conditioning Sometimes this thermal management is not evident but it is essential for our comfort and lifestyle In addition heat transfer is vital in many industrial processes Thermal energy analysis is a complex task that usually requires different approaches With five sections this book provides information on heat transfer problems and using experimental techniques and computational models to analyse them

Porous and Complex Flow Structures in Modern Technologies Adrian Bejan, Ibrahim Dincer, Sylvie Lorente, Antonio Miguel, Heitor Reis, 2013-03-09 Porous and Complex Flow Structures in Modern Technologies represents a new approach to the field considering the fundamentals of porous media in terms of the key roles played by these materials in modern technology Intended as a text for advanced undergraduates and as a reference for practicing engineers the book uses the physics of flows in porous materials to tie together a wide variety of important issues from such fields as biomedical engineering energy conversion civil engineering electronics chemical engineering and environmental engineering Thus for example flows of water and oil through porous ground play a central role in energy exploration and recovery oil wells geothermal fluids energy conversion effluents from refineries and power plants and environmental engineering leachates from waste repositories Similarly the demands of miniaturization in electronics and in biomedical applications are driving research into the flow of heat and fluids through small scale porous media heat

exchangers filters gas exchangers Filters catalytic converters the drying of stored grains and a myriad of other applications involve flows through porous media By providing a unified theoretical framework that includes not only the traditional homogeneous and isotropic media but also models in which the assumptions of representative elemental volumes or global thermal equilibrium fail the book provides practicing engineers the tools they need to analyze complex situations that arise in practice This volume includes examples solved problems and an extensive glossary of symbols Heat Transfer Handbook Adrian Bejan, Allan D. Kraus, 2003-06-30 Chapters contributed by thirty world renown experts Covers all aspects of heat transfer including micro scale and heat transfer in electronic equipment An associated Web site offers computer formulations on thermophysical properties that provide the most up to date values **Shape and Structure, from Engineering to Nature** Adrian Bejan, 2000-10-16 Seemingly universal geometric forms unite the flow systems of engineering and nature For example tree shaped flows can be seen in computers lungs dendritic crystals urban street patterns and communication links In this groundbreaking book first published in 2000 Adrian Bejan considers the design and optimization of engineered systems and discovers a deterministic principle of the generation of geometric form in natural systems Shape and structure spring from the struggle for better performance in both engineering and nature This idea is the basis of the new constructal theory the objective and constraints principle used in engineering is the same mechanism from which the geometry in natural flow systems emerges From heat exchangers to river channels the book draws many parallels between the engineered and the natural world Among the topics covered are mechanical structure thermal structure heat trees ducts and rivers turbulent structure and structure in transportation and economics The numerous illustrations examples and homework problems in every chapter make this an ideal text for engineering design courses Its provocative ideas will also appeal to a broad range of readers in engineering natural sciences economics and business Theory in the "Post" Era Christian Moraru, Andrei Terian, Alexandru Matei, 2021-08-26 Shortlisted for the AATSEEL 2022 Award for Best Edited Multi Author Scholarly Volume AATSEEL is The American Association of Teachers of Slavic and East European Languages Theory in the Post Era brings together the work and perspectives of a group of Romanian theorists who discuss the morphings of contemporary theory in what the editors call the post era Since the Cold War s end and especially in the third millennium theorists have been exploring the aftermath and sometimes just the after of whole paradigms the crisis or passing of anthropocentrism the twilight of an entire ontological and cultural condition as well as the corresponding rise of an antagonist model of an anti meta or neo alternative with examples ranging from posthumanism and post postmodernism to post aesthetics postanalogue interpretation or digicriticism post presentism post memory post or neo critique and so forth It is no coincidence the contributors to this volume argue that this post moment is also a time when theory is practiced as a world genre If theory has always been a worlded enterprise a quintessentially communal cross cultural and international project this is truer at present than ever Perhaps more than other humanist constituencies today s theorists work and belong in a theory commons that is

transnational if still uneven economically politically and otherwise Theory in the Post Era reports the results of Romanian theory experiments that join efforts made in other places to foster a theory for the post age
