

ATP Es una herramienta de software que permite la simulación digital de fenómenos transitorios de naturaleza electromagnética y electrostática con fines de diseño, especificación de equipos y definición de parámetros eléctricos.

El software resuelve sistemas algebraicos, numéricos, polinómicos, calculando el valor que adquieren a lo largo del tiempo las variables del mismo. Trabaja con modelos que caracterizan el comportamiento de los distintos elementos constitutivos: reacciones, inducciones, inhibiciones, conmutadores, elementos de pastoreo, conectores y/o distribuidos, mutaciones, migraciones, etc.

La capacidad resuelve ecuaciones de sistemas de flujo de masas, como reacciones, como flujos, como intercambios, con submodelos asociados a cada elemento de los mismos.

The *z*-transformed generator transmits the elements of the finite kernel matrix, kernel matrix, state matrix, state input/output, and multiplicity information to the *z*-transform.

En los años 80, Herman Dornoff ² desarrolló para la Bonneville Power Administration (BPA) una aplicación computacional digital para simulación de circuitos eléctricos, sistemas electromecánicos y sistemas de control Remada Electromagnética Transiente Program (RETP).

En 1984 inicia el desarrollo de EMTP para su ejecución en computadores personales por parte de DCC y del Electric Power Research Institute (EPRI) con fines comerciales.⁷ Un grupo de usuarios aficionados, formado de los colegas que eran adheridos desarrollados por CPAL, trabajaron la iniciativa y continuaron con la opción libre y abierta original y continuaron con el proyecto, desarrollando el Alternative Transient Program (ATP), lo que hizo accesible al EMTP a un mayor número de usuarios.

La anterior impulsó la elaboración de trabajos y la divulgación de la nueva herramienta informática por muchos usuarios.² Desde entonces, la herramienta se ha desarrollado a través de contribuciones de usuarios alrededor del mundo, independientes de EMTE.

A finales de los años 80 se presentó la primera versión de la herramienta *NETPENS*, desarrollada de manera independiente y que permitía dibujar un circuito en un único gráfico en lugar de tener que escribir un archivo de texto con la información de la simulación deseada.

El software fue traído a Colombia por Luis Fernando Mandón, trabajador de la oficina de planeación de ICA, en 1986, luego de un curso de capacitación en la herramienta que realizó en Brasil. En 1998, se creó el grupo nacional de UNIF y con el fin de mejorar la difusión de la herramienta en el país. ¹¹

A pensar de que la herramienta KSTIP que realizó RPA se mantiene en dominio público, KTF regala su Nueva Lamineta. El software es gratuito y en Nueva Lamineta se realiza con grupos de usuarios. ¿?

El software se compone de un compilador ATP y una serie de programas complementarios que facilitan el uso de la herramienta. Los complementarios son: editores de texto, editor gráfico de circuitos electrónicos y aplicaciones para visualización de los resultados obtenidos.

A via de Wood-Werkman é a mais antiga e a mais simples, sendo a base da maioria das vias metabólicas. A via de Embden-Meyerhof é a mais comum e a mais eficiente, sendo a base da maioria das vias metabólicas. A via de Entner-Doudoroff é a mais recente e a mais complexa, sendo a base da maioria das vias metabólicas.
