Smirnov,2014-11-17 This book presents the theory of gas discharge plasmas in a didactical way It explains the processes in gas discharge plasmas A gas discharge plasma is an ionized gas which is supported by an external electric field Therefore its parameters are determined by processes in it The properties of a gas discharge plasma depend on its gas component types of external fields their geometry and regimes of gas discharge Fundamentals of a gas discharge plasma include elementary radiative and transport processes which are included in its kinetics influence They are represented in this book together with the analysis of simple gas discharges These general principles are applied to stationary gas discharge plasmas of helium and argon The analysis of such plasmas under certain conditions is theoretically determined by numerical plasma parameters for given regimes and conditions *Mechanics of Turbulence of Multicomponent Gases* Mikhail Ya. Marov,Aleksander V.

Kolesnichenko,2006-04-18 Space exploration and advanced astronomy have dramatically expanded our knowledge of outer space and made it possible to study the indepth mechanisms underlying various natural phenomena caused by complex interaction of physical chemical and dynamical processes in the universe Huge breakthroughs in astrophysics and the planetary sciences have led to increasingly complicated models of such media as giant molecular clouds giving birth to stars protoplanetary accretion disks associated with the solar system's formation planetary atmospheres and circumplanetary space The creation of these models was promoted by the development of basic approaches in modern mechanics and physics paralleled by the great advancement in the computer sciences As a result numerous multidimensional non stationary problems involving the analysis of evolutionary processes can be investigated using wide range numerical experiments Turbulence belongs to the most widespread and at the same time the most complicated natural phenomena related to the origin and development of organized structures dies of different scale at a definite flow regime of fluids in essentially non linear hydrodynamic systems This is also one of the most complex and intriguing sections of the mechanics of fluids The direct numerical modeling of turbulent flows encounters large mathematical difficulties while the development of a general turbulence theory is hardly possible because of the complexity of interacting coherent structures Three dimensional non steady motions arise in such a system under loss of laminar flow stability defined by the critical value of the Reynolds number
