Sheppard,2025-02-20 The creation of complex integrated systems is in itself complex It requires immense planning and a
large team of people with diverse backgrounds based in dispersed geographical locations and countries supposedly working
to a coordinated schedule and cost The systems engineering task is not new but recent scales most definitely are The world is
now capable of designing and manufacturing systems whose complexity was not considered possible 10 years ago While
many are trained to think in terms of a complete system where everything is designed and produced by a single project team
today such systems involve integrating subsystems and components which are also complex that have been developed by
other project teams Inevitably this introduces additional complexities involving elements out of the direct control of the
project but which are essential to its overall success In addition to traditional systems engineering topics of hardware and
software design testability and manufacturability there are wider issues to be contemplated project planning communication
language an issue for international teams units of measure imperial vs metric used across members of the team supply chains
pandemics military action and natural disasters legal issues based on place of production and sale the ethics associated with
target use and the threat of cyberattack This book is the first attempt to bring many of these issues together to highlight the
complexities that need to be considered in modern system design It is neither exhaustive nor comprehensive but it gives
pointers to the topics for the reader to follow up on in more detail *Federal Register* ,1993 **Automatic Train Control**
