Application Design For Wearable Computing Synthesis Lectures On Mobile And Pervasive Computing:

Application Design for Wearable Computing Dan Siewiorek, Asim Smailagic, Thad Starner, 2022-06-01 The confluence of decades of computer science and computer engineering research in multimodal interaction e.g. speech and gesture recognition machine learning e.g. classification and feature extraction software e.g. web browsers distributed agents electronics e.g. energy efficient microprocessors head mounted displays design methodology in user centered design and rapid prototyping have enabled a new class of computers wearable computers The lecture takes the viewpoint of a potential designer or researcher in wearable computing Designing wearable computers requires attention to many different factors because of the computer's closeness to the body and its use while performing other tasks For the purposes of discussion we have created the UCAMP framework which consists of the following factors user corporal attention manipulation and perception Each of these factors and their importance is described A number of example prototypes developed by the authors as well as by other researchers are used to illustrate these concepts Wearable computers have established their first foothold in several application domains such as vehicle and aircraft maintenance and manufacturing inspection language translation and other areas The lecture continues by describing the next step in the evolution of wearable computers namely context awareness Context aware computing takes into account a user's state and surroundings and the mobile computer modifies its behavior based on this information A user's context can be quite rich consisting of attributes such as physical location physiological state personal history daily behavioral patterns and so forth If a human assistant were given such context he or she would make decisions in a proactive fashion anticipating user needs and acting as a proactive assistant The goal is to enable mobile computers to play an analogous role exploiting context information to significantly reduce demands on human attention Context aware intelligent agents can deliver relevant information when a user needs that information These data make possible many exciting new applications such as augmented reality context aware collaboration and augmented manufacturing The combined studies and research reported in this lecture suggest a number of useful guidelines for designing wearable computing devices Also included with the guidelines is a list of questions that designers should consider when beginning to design a wearable computer The research directions section emphasizes remaining challenges and trends in the areas of user interface modalities of interaction and wearable cognitive augmentation Finally we summarize the most important challenges and conclude with a projection of future directions in wearable computing Table of Contents Introduction The Wearable Computing UCAMP Design Guidelines for Wearable Computing Research Directions Conclusions and Future Challenges

Replicated Data Management for Mobile Computing Terry Douglas, 2022-05-31 Managing data in a mobile computing environment invariably involves caching or replication In many cases a mobile device has access only to data that is stored locally and much of that data arrives via replication from other devices PCs and services Given portable devices with limited resources weak or intermittent connectivity and security vulnerabilities data replication serves to

increase availability reduce communication costs foster sharing and enhance survivability of critical information Mobile systems have employed a variety of distributed architectures from client server caching to peer to peer replication Such systems generally provide weak consistency models in which read and update operations can be performed at any replica without coordination with other devices The design of a replication protocol then centers on issues of how to record propagate order and filter updates Some protocols utilize operation logs whereas others replicate state Systems might provide best effort delivery using gossip protocols or multicast or guarantee eventual consistency for arbitrary communication patterns using recently developed pairwise knowledge driven protocols Additionally systems must detect and resolve the conflicts that arise from concurrent updates using techniques ranging from version vectors to read write dependency checks This lecture explores the choices faced in designing a replication protocol with particular emphasis on meeting the needs of mobile applications It presents the inherent trade offs and implicit assumptions in alternative designs The discussion is grounded by including case studies of research and commercial systems including Coda Ficus Bayou Sybase s iAnywhere and Microsoft s Sync Framework Table of Contents Introduction System Models Data Consistency Replicated Data Protocols Partial Replication Conflict Management Case Studies Conclusions Bibliography

A Practical Guide to Testing Wireless Smartphone Applications Julian Harty, 2022-06-01 Testing applications for mobile phones is difficult time consuming and hard to do effectively Many people have limited their testing efforts to hands on testing of an application on a few physical handsets and they have to repeat the process every time a new version of the software is ready to test They may miss many of the permutations of real world use and as a consequence their users are left with the unpleasant mess of a failing application on their phone Test automation can help to increase the range and scope of testing while reducing the overhead of manual testing of each version of the software However automation is not a panacea particularly for mobile applications so we need to pick our test automation challenges wisely This book is intended to help software and test engineers pick appropriately to achieve more and as a consequence deliver better quality working software to users This Synthesis lecture provides practical advice based on direct experience of using software test automation to help improve the testing of a wide range of mobile phone applications including the latest AJAX applications The focus is on applications that rely on a wireless network connection to a remote server however the principles may apply to other related fields and applications We start by explaining terms and some of the key challenges involved in testing smartphone applications Subsequent chapters describe a type of application e g markup AJAX Client followed by a related chapter on how to test each of these applications Common test automation techniques are covered in a separate chapter and finally there is a brief chapter on when to test manually The book also contains numerous pointers and links to further material to help you to improve your testing using automation appropriately Table of Contents Introduction Markup Languages Testing Techniques for Markup Applications AJAX Mobile Applications Testing Mobile AJAX Applications Client Applications Testing Techniques
