Artificial Intelligence In Real Time Control 1991 Ifac Workshop Series:

Artificial Intelligence in Real-Time Control 1991 M.G. Rodd, G. J. Suski, 2014-05-23 This set of proceedings contains the most significant papers presented at the third IFAC Workshop on Artificial Intelligence in Real time Control which was held from September 23 25 1991 in the USA In this workshop although there were still some exotic applications a more practical view of the applications and limitations of current AI technology dominated the participants discussions With its resultant focus on reliability and safety considerations the workshop posed as many questions as it answered It provides an excellent mirror of the current state of the art which these proceedings are intended to illustrate

Algorithms and Architectures for Real-Time Control 1991 P.J. Fleming, D.I. Jones, 2014-07-22 Computer scientists have long appreciated that the relationship between algorithms and architecture is crucial Broadly speaking the more specialized the architecture is to a particular algorithm then the more efficient will be the computation The penalty is that the architecture will become useless for computing anything other than that algorithm This message holds for the algorithms used in real time automatic control as much as any other field These Proceedings will provide researchers in this field with a useful up to date reference source of recent developments

Artificial Intelligence in Real-Time Control 1994 A. Crespo, 2014-06-28 Artificial Intelligence is one of the new technologies that has contributed to the successful development and implementation of powerful and friendly control systems These systems are more attractive to end users shortening the gap between control theory applications The IFAC Symposia on Artificial Intelligence in Real Time Control provides the forum to exchange ideas and results among the leading researchers and practitioners in the field This publication brings together the papers presented at the latest in the series and provides a key evaluation of present and future developments of Artificial Intelligence in Real Time Control system technologies

Distributed Computer Control Systems 1991 H. Kopetz, M.G. Rodd, 2014-07-04 Distributed computer control is at the intersection between control engineering and computer science Containing 22 papers this book provides an up to date reference source of important issues in the design and implementation of distributed real time computer systems

Artificial Intelligence in Real-Time Control 1992 M.G. Rodd, H.B. Verbruggen, 2014-06-28 The symposium had two main aims to investigate the state of the art in the application of artificial intelligence techniques in real time control and to bring together control system specialists artificial intelligence specialists and end users Many professional engineers working in

industry feel that the gap between theory and practice in applying control and systems theory is widening despite efforts to develop control algorithms. Papers presented at the meeting ranged from the theoretical aspects to the practical applications of artificial intelligence in real time control. Themes were the methodology of artificial intelligence techniques in control engineering, the application of artificial intelligence techniques in different areas of control and hardware and software requirements. This symposium showed that there exist alternative possibilities for control based on artificial intelligence techniques.

The BOXES Methodology Second Edition David W. Russell, 2021-11-18. This book focuses on how the BOXES Methodology, which is based on the work of Donald Michie, is applied to ill-defined real time control systems with minimal a priori knowledge of the system. The method is applied to a variety of systems including the familiar pole and cart. This second edition includes a new section that covers some further observations and thoughts, problems and evolutionary extensions that the reader will find useful in their own implementation of the method. This second edition includes a new section on how to handle jittering about a system boundary which in turn causes replicated run times to become part of the learning mechanism. It also addresses the aging of data values using a forgetfulness factor that causes wrong values of merit to be calculated. Another question that is addressed is: Should a BOXES cell ever be considered fully trained and if so excluded from further dynamic updates? Finally, it expands on how system boundaries may be shifted using data from many runs using an evolutionary paradigm.

The BOXES Methodology David W. Russell, 2012-03-14. Robust control mechanisms customarily require knowledge of the system's describing equations, which may be of the high order differential type. In order to produce these equations, mathematical models can often be derived and correlated with measured dynamic behavior. There are two flaws in this approach: one is the level of inexactness introduced by linearizations, and the other when no model is apparent. Several years ago, a new genre of control systems came to light that are much less dependent on differential models, such as fuzzy logic and genetic algorithms. Both of these soft computing solutions require quite considerable a priori system knowledge to create a control scheme and sometimes a complicated training program before they can be implemented in a real world dynamic system. Michie and Chambers' BOXES methodology created a black box system that was designed to control a mechanically unstable system with very little a priori system knowledge, linearization or approximation. All the method needed was some notion of maximum and minimum values for the state variables and a set of boundaries that divided each variable into an integer state number. The BOXES Methodology applies the method to a variety of systems, including continuous and chaotic dynamic systems, and discusses how it may be possible to create a generic control method that is self-organizing and adaptive, that learns with the assistance of near neighbouring states. The BOXES Methodology introduces students at the undergraduate and master's level to black box dynamic system control and gives lecturers access to background materials that can be used in their courses in support of student research and classroom presentations in novel control systems and real time applications of artificial intelligence. Designers are provided with a novel method of

optimization and controller design when the equations of a system are difficult or unknown Researchers interested in artificial intelligence AI research and models of the brain and practitioners from other areas of biology and technology are given an insight into how AI software can be written and adapted to operate in real time **European Control Conference 1991** ,1991-07-02 Proceedings of the European Control Conference 1991 July 2 5 1991 Grenoble France Artificial Intelligence in Industrial Decision Making, Control and Automation S.G. Tzafestas,H. B. Verbruggen,2012-12-06 This book is concerned with Artificial Intelligence AI concepts and techniques as applied to industrial decision making control and automation problems The field of AI has been expanded enormously during the last years due to that solid theoretical and application results have accumulated During the first stage of AI development most workers in the field were content with illustrations showing ideas at work on simple problems Later as the field matured emphasis was turned to demonstrations that showed the capability of AI techniques to handle problems of practical value Now we arrived at the stage where researchers and practitioners are actually building AI systems that face real world and industrial problems This volume provides a set of twenty four well selected contributions that deal with the application of AI to such real life and industrial problems These contributions are grouped and presented in five parts as follows Part 1 General Issues Part 2 Intelligent Systems Part 3 Neural Networks in Modelling Control and Scheduling Part 4 System Diagnostics Part 5 Industrial Robotic Manufacturing and Organizational Systems Part 1 involves four chapters providing background material and dealing with general issues such as the conceptual integration of qualitative and quantitative models the treatment of timing problems at system integration and the investigation of correct reasoning in interactive man robot systems
