Algebraic Topology Of Finite Topological Spaces And Applications Lecture Notes In Mathematics:

Algebraic Topology of Finite Topological Spaces and Applications Jonathan A. Barmak, 2011-08-24 This volume deals with the theory of finite topological spaces and its relationship with the homotopy and simple homotopy theory of polyhedra The interaction between their intrinsic combinatorial and topological structures makes finite spaces a useful tool for studying problems in Topology Algebra and Geometry from a new perspective In particular the methods developed in this manuscript are used to study Quillen's conjecture on the poset of p subgroups of a finite group and the Andrews Curtis conjecture on the 3 deformability of contractible two dimensional complexes This self contained work constitutes the first detailed exposition on the algebraic topology of finite spaces It is intended for topologists and combinatorialists but it is also recommended for advanced undergraduate students and graduate students with a modest knowledge of Algebraic Topology **Geometry and**

Topology of Manifolds: Surfaces and Beyond Vicente Muñoz, Ángel González-Prieto, Juan Ángel Rojo, 2020-10-21 This book represents a novel approach to differential topology Its main focus is to give a comprehensive introduction to the classification of manifolds with special attention paid to the case of surfaces for which the book provides a complete classification from many points of view topological smooth constant curvature complex and conformal Each chapter briefly revisits basic results usually known to graduate students from an alternative perspective focusing on surfaces We provide full proofs of some remarkable results that sometimes are missed in basic courses e.g the construction of triangulations on surfaces the classification of surfaces the Gauss Bonnet theorem the degree genus formula for complex plane curves the existence of constant curvature metrics on conformal surfaces and we give hints to questions about higher dimensional manifolds Many examples and remarks are scattered through the book Each chapter ends with an exhaustive collection of problems and a list of topics for further study The book is primarily addressed to graduate students who did take standard introductory courses on algebraic topology differential and Riemannian geometry or algebraic geometry but have not seen their deep interconnections which permeate a modern approach to geometry and topology of manifolds **Connection**

Matrices in Combinatorial Topological Dynamics Marian Mrozek, Thomas Wanner, 2025-07-08 This book provides an introduction to the theory of connection matrices in the context of combinatorial multivector fields The theory of connection matrices was proposed by Conley and Franzosa for classical continuous time dynamical systems as a tool for studying connecting orbits between isolated invariant sets It generalizes the Morse complex in Morse theory and has found numerous applications in dynamics Connection matrices have been and still are a challenging topic to study as there are no complete introductory texts and both their intricate definition and properties are scattered over numerous research papers In recent years dynamical concepts have found their way into a combinatorial context Starting with combinatorial vector fields introduced by Forman to generalize classical Morse theory it has been realized that this transfer of ideas can lead to important applications Similarly Conley's theory of isolated invariant sets has been transferred to the combinatorial setting

This when combined with the concept of multivector fields opens the door to a complete combinatorial dynamical theory In this book we take Conley's theory one step further by presenting a complete discussion of connection matrices for combinatorial multivector fields While some of the results in this book are based on known approaches we show in a detailed way how they can be carried over to the case of multivector fields on general Lefschetz complexes Along the way we introduce notions which are new even in the classical setting such as a formal approach to addressing the nonuniqueness of connection matrices as well as mechanisms for comparing connection matrices even under poset changes Finally we show that specifically for the case of Forman's gradient combinatorial vector fields connection matrices are necessarily unique and can be determined explicitly in a straightforward way Focusing on the combinatorial theory of connection matrices has a number of advantages On the one hand many of the technical difficulties of the classical continuous time dynamics situation are not present in the discrete combinatorial context This allows us to provide a complete and informal introduction to the theory in the second section of the book This in turn will enable the readers to construct and analyze their own examples easily On the other hand the complete theory including the existence of connecting orbits in the combinatorial setting can be presented in detail based on an explicit distinction between the algebraic and topological parts of the theory In this way it is our hope that this book will be an impetus for further knowledge transfer between dynamics and combinatorics and even topological data analysis This text is aimed at researchers in the fields of dynamics and topological data analysis and it is suitable for advanced graduate students interested in applying connection matrix methods to their own studies

Pattern Recognition on Oriented Matroids Andrey O. Matveev, 2017-09-11 Pattern Recognition on Oriented Matroids covers a range of innovative problems in combinatorics poset and graph theories optimization and number theory that constitute a far reaching extension of the arsenal of committee methods in pattern recognition The groundwork for the modern committee theory was laid in the mid 1960s when it was shown that the familiar notion of solution to a feasible system of linear inequalities has ingenious analogues which can serve as collective solutions to infeasible systems A hierarchy of dialects in the language of mathematics for instance open cones in the context of linear inequality systems regions of hyperplane arrangements and maximal covectors or topes of oriented matroids provides an excellent opportunity to take a fresh look at the infeasible system of homogeneous strict linear inequalities the standard working model for the contradictory two class pattern recognition problem in its geometric setting The universal language of oriented matroid theory considerably simplifies a structural and enumerative analysis of applied aspects of the infeasibility phenomenon The present book is devoted to several selected topics in the emerging theory of pattern recognition on oriented matroids the questions of existence and applicability of matroidal generalizations of committee decision rules and related graph theoretic constructions to oriented matroids with very weak restrictions on their structural properties a study in which in particular interesting subsequences of the Farey sequence appear naturally of the hierarchy of the corresponding tope committees a description of

the three tope committees that are the most attractive approximation to the notion of solution to an infeasible system of linear constraints an application of convexity in oriented matroids as well as blocker constructions in combinatorial optimization and in poset theory to enumerative problems on tope committees an attempt to clarify how elementary changes one element reorientations in an oriented matroid affect the family of its tope committees a discrete Fourier analysis of the important family of critical tope committees through rank and distance relations in the tope poset and the tope graph the characterization of a key combinatorial role played by the symmetric cycles in hypercube graphs Contents Oriented Matroids the Pattern Recognition Problem and Tope Committees Boolean Intervals Dehn Sommerville Type Relations Farey Subsequences Blocking Sets of Set Families and Absolute Blocking Constructions in Posets Committees of Set Families and Relative Blocking Constructions in Posets Layers of Tope Committees Three Tope Committees Halfspaces Convex Sets and Tope Committees Tope Committees and Reorientations of Oriented Matroids Topes and Critical Committees Critical Committees and Distance Signals Symmetric Cycles in the Hypercube Graphs Homotopy Invariant Algebraic Structures on Topological Spaces J. M. Boardman, R. M. Vogt, 2006-11-15 *Discrete Morse Theory* Nicholas A. Scoville, 2019-09-27 Discrete Morse theory is a powerful tool combining ideas in both topology and combinatorics Invented by Robin Forman in the mid 1990s discrete Morse theory is a combinatorial analogue of Marston Morse's classical Morse theory Its applications are vast including applications to topological data analysis combinatorics and computer science This book the first one devoted solely to discrete Morse theory serves as an introduction to the subject Since the book restricts the study of discrete Morse theory to abstract simplicial complexes a course in mathematical proof writing is the only prerequisite needed Topics covered include simplicial complexes simple homotopy collapsibility gradient vector fields Hasse diagrams simplicial homology persistent homology discrete Morse inequalities the Morse complex discrete Morse homology and strong discrete Morse functions Students of computer science will also find the book beneficial as it includes topics such as Boolean functions evasiveness and has a chapter devoted to some computational aspects of discrete Morse theory The book is appropriate for a course in discrete Morse theory a supplemental text to a course in algebraic topology or topological combinatorics or an independent study **Formal Methods and Software Engineering** Yi Li, Sofiène Tahar, 2023-11-09 This book constitutes the proceedings of the 24th International Conference on Formal Methods and Software Engineering ICFEM 2023 held in Brisbane QLD Australia during November 21-24, 2023 The 13 full papers presented together with 8 doctoral symposium papers in this volume were carefully reviewed and selected from 34 submissions the volume also contains one invited paper The conference focuses on applying formal methods to practical applications and presents papers for research in all areas related to formal engineering methods **Algebraic Topology and Its Applications** Gunnar E. Carlsson, Ralph L. Cohen, Wu-Chung Hsiang, John D.S. Jones, 2012-12-06 In 1989-90 the Mathematical Sciences Research Institute conducted a program on Algebraic Topology and its Applications The main areas of concentration were homotopy

theory K theory and applications to geometric topology gauge theory and moduli spaces Workshops were conducted in these three areas This volume consists of invited expository articles on the topics studied during this program They describe recent advances and point to possible new directions They should prove to be useful references for researchers in Algebraic

Topology and related fields as well as to graduate students **Open Problems in Topology II** Elliott M. Pearl, 2011-08-11
