Arteriosclerosis Hypertension Chapters Pressure Classic:

Arteriosclerosis and Hypertension: With Chapters on Blood Pressure Louis Marshall Warfield, 2011-01-01 The aorta and its branches are highly elastic tubes having a smooth glistening inner surface When the arteries are cut open they present a yellowish appearance due to the large quantity of elastic tissue contained in the walls The elasticity is practically perfect being both longitudinal and transverse The essential portion of any blood vessel is the endothelial tube composed of flat cells cemented together by intercellular substance and having no stomata between the cells This tube is reinforced in different ways by connective tissue smooth muscle fibers and fibroelastic tissue Although the gradations from the larger to the smaller arteries and from these to the capillaries and veins are almost insensible yet particular arteries present structural characters sufficiently marked to admit of histological differentiation The whole vascular system including the heart has an endothelial lining which may constitute a distinct inner coat the tunica intima or may be without coverings as in the case of the capillaries The intima Fig 1 consists typically of endothelium reinforced by a variable amount of fibroelastic tissue in which the elastic fibers predominate The tunica media is composed of intermingled bundles of elastic tissue smooth muscle fibers and some fibrous tissue The adventitia or outer coat is exceedingly tough It is usually thinner than the media and is composed of fibroelastic tissue This division into three coats is however somewhat arbitrary as in the larger arteries particularly it is difficult to discover any distinct separation into layers

Arteriosclerosis and Hypertension Louis Marshall Warfield, 2015-07-12 Excerpt from Arteriosclerosis and Hypertension With Chapters on Blood Pressure Several years have elapsed since the appearance of the second edition of this book During this time there has been considerable experimentation and much writing on arteriosclerosis The total of all work has not been to add very much to our knowledge of the etiology of arterial degeneration Points of view and opinions change from time to time It is so with arteriosclerosis In this edition arteriosclerosis is not regarded as a disease with a definite etiologic factor Rather it is looked upon as a degenerative process affecting the arteries following a variety of causes more or less ill defined It is not considered a true disease Possibly syphilitic arteritis may be viewed as an entity the cause is known and the lesions are characteristic Much new material and many new figures have been added to this edition Some rearranging has been done The chapter on Blood Pressure has been much expanded and some original observations have been included The literature has been selected rather than indiscriminately quoted Much that is written on the subject is of little value It has always seemed to the author that there is not enough of the personal element in medical writings At the risk of being severely criticized he has attempted to make this book represent largely his own ideas only here and there quoting from the literature New chapters on Cardiac Irregularities Associated with Arteriosclerosis and Blood Pressure in Its Clinical Application have been added The fact that the book has passed through two editions is very gratifying and seems to show that it has met with favor The author takes this opportunity of thanking those who have loaned him illustrations Wherever figures are borrowed due credit is given

Atherosclerosis, Large Arteries and Cardiovascular Risk Michel Safar, Edward D. Frohlich, 2007. Arterial stiffness is now firmly established as an important and independent predictor of cardiovascular risk. The structural and functional changes of the large arteries may be age-related but a number of conditions have been associated with accelerated arterial stiffening including the hypertensive diseases, atherosclerosis, end-stage renal disease and traditional cardiovascular risk factors such as diabetes mellitus and smoking. This book presents the current thinking of international experts regarding the underlying mechanisms of cardiovascular risk and the pathogenesis and pathophysiology of large arterial stiffness and reduced large arterial distensibility. It not only gives new insights into the relationship between arterial stiffness and atherosclerosis but also establishes the possible interactions with age and other cardiovascular factors such as high blood pressure, diabetes and hyperlipidemia. Finally, the therapeutic means of approaching arterial stiffness are analyzed in detail and new perspectives for the treatment and prevention of cardiovascular diseases are developed. Authoritative and up to date, this book is a valuable resource for basic scientists interested in vascular physiology and pathophysiology for clinicians in the areas of cardiology, diabetes and renal diseases as well as for investigators in drug development.
