Current Trends In Theoretical

Computer Science - Entering The 21st Century Gheorghe Paun, Grzegorz Rozenberg, Arto Salomaa, 2001-02-12 The

scientific developments at the end of the past millennium were dominated by the huge increase and diversity of disciplines with the common label computer science. The theoretical foundations of such disciplines have become known as theoretical computer science. This book highlights some key issues of theoretical computer science as they seem to us now at the beginning of the new millennium. The text is based on columns and tutorials published in the Bulletin of the European Association for Theoretical Computer Science in the period 1995-2000. The columnists themselves selected the material they wanted for the book and the editors had a chance to update their work. Indeed, much of the material presented here appears in a form quite different from the original. Since the presentation of most of the articles is reader friendly and does not presuppose much knowledge of the area, the book constitutes suitable supplementary reading material for various courses in computer science.

21st Century Prometheus Maurizio Martellini, Ralf Trapp, 2020-03-11. This book describes the evolving CBRN risk landscape and highlights advances in the core CBRN technologies, including when combined with improvised explosive devices. CBRN threats. It analyses how associated technologies create new safety and security risks, challenging certain assumptions that underlie current control regimes. The book also shows how technologies can be enablers for more effective strategies to mitigate these risks. 21st century safety and security risks emanating from chemical, biological, radiological, and nuclear materials, whether resulting from natural events, accidents, or malevolent use, are increasingly shaped by technologies that enable their development, production, or use in ways that differ from the past. Artificial intelligence, the use of cyberspace, the revolution in the life sciences, new manufacturing methods, new platforms and equipment for agent delivery, hypersonic weapons, systems, information tools utilised in hybrid warfare: these and other technologies are reshaping the global security environment and CBRN landscape. They are leading to a growing potential for highly targeted violence.

and they can lead to greater instability and vulnerability worldwide At the same time technology offers solutions to manage CBRN risks Examples are faster detection more accurate characterisation of the nature and origin of CBRN agents new forensic investigation methods or new medical treatments for victims of CBRN incidents New educational concepts help to foster a culture of responsibility in science and technology and strengthen governance New training methods help develop practical skills to manage CBRN risks more effectively The book concludes that there is a growing need for a holistic framework towards CBRN risk mitigation Traditional arms control mechanisms such as global regional or bilateral treaties and export controls are still needed as they provide a necessary legal and institutional framework But laws and technology denial alone will not suffice and institutional mechanisms can at times be weak Given the pace of technological progress and the diffusion of critical knowledge tools and materials policymakers must accept that CBRN risks cannot be eliminated altogether Instead society has to learn to manage these risks and develop resilience against them This requires a softer broadly based multi stakeholder approach involving governments industry the research and development communities educators and civil society Furthermore educating policymakers that cutting edge technologies may seriously affect global strategic stability could create incentives for developing a more creative and contemporary arms control strategy that fosters cooperation rather than incremental polarisation
