An Adaptive Approach for Precise Underwater Vehicle Control in Combined Robot-Diver Operations Naval Postgraduate Naval Postgraduate School, 2015-05-27 Joint robot human operations potentially increase the efficiency effectiveness and safety of the tasks they perform The utilization of an autonomous underwater vehicle AUV as a robotic diver s assistant demands joint dynamic operations involving precise physical interactions between an AUV human divers and the environment which in turn requires a robust accurate control system A robot acting as a dive assistant would perform tasks such as tool carrying worksite illumination or other general assistance jobs that a dive buddy might perform Such precise control of the AUV normally requires accurate knowledge of the vehicle s dynamics however this high level of accuracy is difficult to obtain without the employment of extensive system identification efforts Additionally the utility of the resulting model is greatly diminished if environmental conditions or vehicle configuration change frequently or unexpectedly An ideal control system allows the AUV to switch between operational modes and objectives while accounting for uncertain environmental conditions payload configurations and possible failures of onboard actuators Adaptive control has many applications in the underwater domain and can give a robotic diver s assistant the flexibility required to enable joint robot diver operations Therefore two adaptive control system approaches Model Reference Adaptive Control and L1 Adaptive Control are investigated here for heave control of the Tethered Hovering Autonomous Underwater System *An Adaptive Approach for Precise Underwater Vehicle Control in Combined Robot-Diver Operations* Naval Postgraduate Naval Postgraduate School, 2016-01-04 Joint robot human operations potentially increase the efficiency effectiveness and safety of the tasks they perform The utilization of an autonomous underwater vehicle AUV as a robotic diver s assistant demands joint dynamic operations involving precise physical interactions between an AUV human divers and the environment which in turn requires a robust accurate control system A robot acting as a dive assistant would perform tasks such as tool carrying worksite illumination or other general assistance jobs that a dive buddy might perform Such precise control of the AUV normally requires accurate knowledge of the vehicle s dynamics however this high level of accuracy is difficult to obtain without the employment of extensive system identification efforts Additionally the utility of the resulting model is greatly diminished if environmental conditions or vehicle configuration change frequently or unexpectedly An ideal control system allows the AUV to switch between operational modes and objectives while accounting for uncertain environmental conditions payload configurations and possible failures of onboard actuators Adaptive control has many applications in the underwater domain and can give a robotic diver s assistant the flexibility required to enable joint robot diver operations Therefore two adaptive control system approaches Model Reference Adaptive Control and L1 Adaptive Control are investigated here for heave control of the Tethered Hovering Autonomous Underwater System **Intelligent Robotics and Applications**

Underwater Robots Gianluca Antonelli, 2013-11-21 The field of robotics continues to flourish and develop In common with general scientific investigation new ideas and implementations emerge quite spontaneously and these are discussed used discarded or subsumed at conferences in the reference journals as well as through the Internet After a little more maturity has been acquired by the new concepts then archival publication as a scientific or engineering monograph may occur The goal of the Springer Tracts in Advanced Robotics is to publish new developments and advances in the fields of

robotics research rapidly and informally but with a high quality It is hoped that prospective authors will welcome the opportunity to publish a structured presentation of some of the emerging robotics methodologies and technologies The monograph written by Gianluca Antonelli is focused on an important class of robotic systems namely underwater vehicle manipulator systems These offer a challenging field for investigation of motion planning and control problems of robots operating in unstructured environments In such a scenario the importance of providing the control system with both motion and force control capabilities becomes crucial for successful execution of complex tasks and missions
