HALF - WAVE RECTIFIER

AIM: - To obtain the load regulation and ripple factor of a half-rectifier.

1. with filter
2. without filter

APPARATUS:

2No's.

Experimental Board
Multimeters

Transformer (0-0-6)
Diode, 1N4007

Capacitor 100uf.
Resistor 1KΩ.
Connecting wires

THEORY:-

During positive half-cycle of the input voltage, the diode D1 is in forward bias and conducts through the load resistor R1. Hence the current produces an output voltage across the load resistor R1, which has the same shape as the +ve half cycle of the input voltage.

During the negative half-cycle of the input voltage, the diode is reverse biased and there is no current through the circuit, i.e., the voltage across R1 is zero. The net result is that only the +ve half cycle of the input voltage appears across the load. The average value of the half wave rectified up voltage is the value measured on dc voltmeter.

For practical circuits, transformer coupling is usually provided for two reasons.

1. The voltage can be stepped-up or stepped-down, as needed.
2. The ac source is electrically isolated from the rectifier. Thus preventing shock hazards in the secondary circuit.
