Despeckle Filtering for Ultrasound Imaging and Video, Volume II Christos P. Loizou,Constantinos S.

Pattichis,2022-06-01 In ultrasound imaging and video visual perception is hindered by speckle multiplicative noise that degrades the quality Noise reduction is therefore essential for improving the visual observation quality or as a pre processing step for further automated analysis such as image video segmentation texture analysis and encoding in ultrasound imaging and video The goal of the first book book 1 of 2 books was to introduce the problem of speckle in ultrasound image and video as well as the theoretical background algorithmic steps and the MatlabTM for the following group of despeckle filters linear despeckle filtering non linear despeckle filtering diffusion despeckle filtering and wavelet despeckle filtering The goal of this book book 2 of 2 books is to demonstrate the use of a comparative evaluation framework based on these despeckle filters introduced on book 1 on cardiovascular ultrasound image and video processing and analysis More specifically the despeckle filtering evaluation framework is based on texture analysis image quality evaluation metrics and visual evaluation by experts This framework is applied in cardiovascular ultrasound image video processing on the tasks of segmentation and structural measurements texture analysis for differentiating between two classes i e normal vs disease and for efficient encoding for mobile applications It is shown that despeckle noise reduction improved segmentation and measurement of tissue structure investigated increased the texture feature distance between normal and abnormal tissue improved image video quality evaluation and perception and produced significantly lower bitrates in video encoding Furthermore in order to facilitate further applications we have developed in MATLABTM two different toolboxes that integrate image IDF and video VDF despeckle filtering texture analysis and image and video quality evaluation metrics The code for these toolsets is open source and these are available to download complementary to the two monographs

differentiating between two classes i.e. normal vs disease and for efficient encoding for mobile applications. It is shown that despeckle noise reduction improved segmentation and measurement of tissue structure investigated. Increased texture feature distance between normal and abnormal tissue improved image video quality evaluation and perception and produced significantly lower bitrates in video encoding. Furthermore, in order to facilitate further applications, we have developed in MATLAB™ two different toolboxes that integrate image IDF and video VDF despeckle filtering, texture analysis, and image and video quality evaluation metrics. The code for these toolsets is open source and these are available to download complementary to the two monographs.

Advances in Diagnostic and Therapeutic Ultrasound Imaging Jasjit S. Suri, 2008

This groundbreaking resource offers you exclusive coverage of the latest techniques in diagnostic and therapeutic 3D ultrasound imaging instrumentation and techniques. Providing a solid overview of potential applications in clinical practice, you find need to know details on major diseases including vascular diseases, breast cancer, cardiac abnormalities, and prostate cancer.

Ultrasound Imaging Joao Miguel Sanches, Andrew F. Laine, Jasjit S. Suri, 2011-12-15

Diagnostic and Therapeutic Ultrasound has recently taken an explosive growth for better, safer, economic, mobile, and high quality healthcare. This technology is very appealing for medical applications because it is non-ionizing, non-invasive, and it is available in most of the medical and clinical facilities. Its low cost when compared with other medical image modalities makes it one of the preferred tools for medical monitoring, follow-up, and diagnosis. Besides the traditional fields of Cardiology and Obstetrics where it is extensively used for long time, it has become also very useful in the diagnosis of diseases of the prostate, liver, and coronaries and carotids atherosclerosis. However, Ultrasound images present poor quality, very low signal to noise ratio, and a lot of artifacts. The extraction of useful information from Ultrasound data for diagnosis is a challenge task that makes this medical image modality a very active field of research. The difficulties are being overcome and novel and advanced methods are being proposed for detection, characterization, and segmentation of abnormalities in several organs. In fact, Ultrasound application range is vast, covering almost all organs of the human body, including the brain where Transcranial Doppler Ultrasound is very important to assess the brain vasculature. This book presents some of the recent advances in Ultrasound imaging technology covering several organs and techniques in a Biomedical Engineering (BME) perspective. The focus of the book is in the algorithms, methodologies, and systems developed by multidisciplinary research teams of engineers and physicians for Computer Aided Diagnosis (CAD) purposes. Cardiovascular and Cancer, the most common life-threatening diseases in western countries, are two of the most important topics focused in the book. However, other advanced issues are also presented, such as Intravascular Ultrasound (3D US) and Ultrasound in Computer Aided Surgery (CAS). Some chapters are direct contributions from medical research groups where Ultrasound has also received great attention in the last decade. By these new techniques based on Ultrasound were introduced in the clinical practice for diagnosis and therapeutics, mainly in hospital facilities.
