

Organization of a Research Paper:

Introduction

A good introduction is relatively short. It tells why the reader should find the paper interesting, explains why the author carried out the research, and gives the background the reader needs to understand and judge the paper.

Specifically, the Introduction defines the nature and extent of the problems studied, relates the research to previous work (usually by a brief review of the literature clearly relevant to the problem), explains the objectives of investigation, and defines any specialized terms or abbreviations to be used in what follows. Remember that the Introduction leads logically to, and clearly states, the hypothesis or principal theme of the paper.

The Introduction should be relatively brief; most journals recommend less than 500 words. Avoid repetition: do not repeat the Abstract in the Introduction (and Introduction in the Discussion). Do not go into an extensive literature review; two to four most relevant and recent citations should be adequate to corroborate a statement. Do not repeat well-known facts nor state the obvious. For example, it is disappointing that even now, i.e., after more than 30 years of concerted efforts in scientific agroforestry and a large volume of literature in the subject, some manuscripts—and, interestingly, some editors—insist on providing a definition of agroforestry in any article on that subject! The Introduction section also may use different tenses: justification and motivation of the study is presented in present tense (“Soils store relatively large amounts of carbon in terrestrial ecosystems.”), whereas the review of literature is presented in past tense (“Studies showed that ...”), or in present perfect tense if it is common knowledge (“Studies have shown that ...”). The objective is written in past tense (“The objective of the current study was ...”). Different journals follow different norms and styles. Some want discussion of literature in the Introduction while some want it in the Discussion section. Some journals require a brief account of the Materials and Methods to be included in the Introduction section, and some may want even the important conclusions presented in the Introduction section, although that tendency is now disappearing.

Search Methodologies Edmund K. Burke,Graham Kendall,2013-10-18 The first edition of Search Methodologies Introductory Tutorials in Optimization and Decision Support Techniques was originally put together to offer a basic introduction to the various search and optimization techniques that students might need to use during their research and this new edition continues this tradition Search Methodologies has been expanded and brought completely up to date including new chapters covering scatter search GRASP and very large neighborhood search The chapter authors are drawn from across Computer Science and Operations Research and include some of the world s leading authorities in their field The book provides useful guidelines for implementing the methods and frameworks described and offers valuable tutorials to students and researchers in the field As I embarked on the pleasant journey of reading through the chapters of this book I became convinced that this is one of the best sources of introductory material on the search methodologies topic to be found The book s subtitle Introductory Tutorials in Optimization and Decision Support Techniques aptly describes its aim and the editors and contributors to this volume have achieved this aim with remarkable success The chapters in this book are exemplary in giving useful guidelines for implementing the methods and frameworks described Fred Glover Leeds School of Business University of Colorado Boulder USA The book aims to present a series of well written tutorials by the leading experts in their fields Moreover it does this by covering practically the whole possible range of topics in the discipline It enables students and practitioners to study and appreciate the beauty and the power of some of the computational search techniques that are able to effectively navigate through search spaces that are sometimes inconceivably large I am convinced that this second edition will build on the success of the first edition and that it will prove to be just as popular Jacek Blazewicz Institute of Computing Science Poznan University of Technology and Institute of Bioorganic Chemistry Polish Academy of Sciences *The British National Bibliography* Arthur James Wells,1991

Rader,2013-06-07 Uniquely blends mathematical theory and algorithm design for understanding and modeling real world problems Optimization modeling and algorithms are key components to problem solving across various fields of research from operations research and mathematics to computer science and engineering Addressing the importance of the algorithm design process Deterministic Operations Research focuses on the design of solution methods for both continuous and discrete linear optimization problems The result is a clear cut resource for understanding three cornerstones of deterministic operations research modeling real world problems as linear optimization problem designing the necessary algorithms to solve these problems and using mathematical theory to justify algorithmic development Treating real world examples as mathematical problems the author begins with an introduction to operations research and optimization modeling that

includes applications from sports scheduling in the airline industry. Subsequent chapters discuss algorithm design for continuous linear optimization problems covering topics such as convexity, Farkas Lemma, and the study of polyhedra, before culminating in a discussion of the Simplex Method. The book also addresses linear programming duality theory and its use in algorithm design, as well as the Dual Simplex Method, Dantzig-Wolfe decomposition, and a primal-dual interior point algorithm. The final chapters present network optimization and integer programming problems, highlighting various specialized topics including label correcting algorithms for the shortest path problem, preprocessing and probing in integer programming, lifting of valid inequalities, and branch-and-cut algorithms. Concepts and approaches are introduced by outlining examples that demonstrate and motivate theoretical concepts. The accessible presentation of advanced ideas makes core aspects easy to understand and encourages readers to understand how to think about the problem, not just what to think. Relevant historical summaries can be found throughout the book, and each chapter is designed as the continuation of the story of how to both model and solve optimization problems by using the specific problems, linear and integer programs, as guides. The book's various examples are accompanied by the appropriate models and calculations, and a related Web site features these models along with Maple™ and MATLAB content for the discussed calculations. Thoroughly class-tested to ensure a straightforward, hands-on approach, *Deterministic Operations Research* is an excellent book for operations research of linear optimization courses at the upper undergraduate and graduate levels. It also serves as an insightful reference for individuals working in the fields of mathematics, engineering, computer science, and operations research who use and design algorithms to solve problems in their everyday work.

Introduction to Operations Research and Management Science James L. Riggs, Michael Shigeru Inoue, 1975

Urban Systems (Routledge Revivals) C. S. Bertuglia, G. Leonardi, S. Occelli, G. A. Rabino, R. Tadei, Alan Wilson, 2013-10-18

This edited collection, first published in 1987, provides a comparative analysis of different approaches to urban modelling and lays the foundations for the possibility of integration and a more unified field. The first part contextualises the development of the field of urban systems modelling, focusing on the variety of approaches and possible implications of this on the future of research and methodology. Next, the editors consider economic and non-economic approaches, followed by an analysis of spatial interaction-based approaches. Providing an overview to the field and research literature, the overarching argument is that there should be an integrated methodological approach to urban system modelling.
