

Adjusting Accelerator Switch On Manifold

Delco-Remy Model 1594.

It is important to follow exactly the sequence of operations shown below, also make careful reference to Figs. 119-120-121.

Engine Idle Adjustment—Refer to Fig. 119

- a. Start engine. If the switch has been disconnected or is badly out of time so that engine will not start, disconnect trunnion from the switch lever and operate switch by hand, by first pulling trunnion end of the lever as far forward as it will go to engage the switch clutch, and then push back the lever until contact is made. The throttle should be held partly open during this operation.
- b. Warm up engine until water temperature indicator on instrument panel shows 140°.
- c. Check, and, if necessary, adjust engine

idle to speed of 8 m.p.h. The idle speed is regulated by turning the IDLE SCREW shown in Fig. 119.

In making this adjustment, it will be observed that the COLD IDLE CONTROL CAM will be in the approximate position shown in Fig. 119, which is the warm idle position, and that the hand throttle is pushed in as far as it will go.

After the engine idle has been adjusted, the accelerator pedal angle should also be checked. This is done by measuring the distance from top of the accelerator pedal to top side of the floor mat, which should agree with dimension shown on Fig. 119. The angle can be changed by removing and adjusting trunnion "A".

Switch Adjustment—Refer to Fig. 120

- a. Rotate COLD IDLE CONTROL around by hand in a counter-clockwise direction until it strikes stop. This is the fast or cold idle position. Leave the cam in this
