Lepley, 1966 Using data obtained during the Deep Freeze 61 marine geophysical investigations the report graphically describes the submarine topography of the eastern Ross Sea and Sulzberger Bay areas of Antarctica The origins of the large depressions and ridges are discussed in the light of their relationship to Pleistocene glacial history and structural geology Author Marine Research , 1969 **Exploration of Subsurface Antarctica** M.J. Siegert, S.S.R. Jamieson, D.A. White, 2018-01-08 Our appreciation of glaciological processes in Antarctica suffers from a lack of observations in regions where numerical models indicate the ice sheet to be susceptible to ocean and or atmospheric warming The solution lies in the use and development of glacier geophysics In this volume we present a series of papers that demonstrate how geophysics can be deployed in Antarctica to comprehend 1 boundary conditions that influence ice flow such as subglacial topography the distribution of basal water and ice sheet rheology 2 phenomena that might affect ice flow processes such as complex internal ice sheet structures and the proposition of large stores of hitherto unappreciated groundwater and 3 how glacial sediments and formerly glaciated terrain on and surrounding the continent can inform us about past ice sheet dynamics The volume also takes a historical view on developments leading to current knowledge examines active ice sheet processes and points the way forward on how geophysics can advance quantitative understanding of Antarctic ice sheet behaviour
