

MASHING

Grains & other sugar sources are added to the mash tun with hot water. This makes wort.

BOILING

Wort is transferred to the kettle & hops are added at various stages. The earlier hops are added, the more alpha acids are imparted. The later they are added, the more aroma is in the brew.

FERMENTATION

The boil is cooled & yeast is added to convert all the sugars gained in the mash tun to alcohol.

FILTERING

Most beer styles are filtered afterwards for clarity, however, some styles call for "haze".

Water John J. Palmer, Colin Kaminski, 2013-09-16 Water is arguably the most critical and least understood of the foundation elements in brewing. For many brewers used to choosing from a wide selection of hops and grain water seems like an ingredient for which they have little choice but to accept what comes out of their faucet. But brewers in fact have many opportunities to modify their source water or to obtain mineral free water and build their own brewing water from scratch. Much of the relevant information can be found in texts on physical and inorganic chemistry or water treatment and analysis but these resources seldom if ever speak to brewers. *Water: A Comprehensive Guide for Brewers* takes the mystery out of water's role in the brewing process. This book is not just about brewing liquor. Whether in a brewery or at home water is needed for every part of the brewing process: chilling, diluting, cleaning, boiler operation, wastewater treatment, and even physically pushing wort or beer from one place to another. The authors lead the reader from an overview of the water cycle and water sources to adjusting water for different beer styles and brewery processes to wastewater treatment. It covers precipitation, groundwater, and surface water and explains how municipal water is treated to make it safe to drink but not always suitable for brewing. The parameters measured in a water report are explained along with their impact on the mash and the final beer. Understand ion concentrations, temporary and permanent hardness, and pH. The concept of residual alkalinity is covered in detail and the causes of alkalinity in water are explored along with techniques to control alkalinity. Ultimately residual alkalinity is the major effector on mash pH and this book addresses how to predict and target a specific mash pH, a key skill for any brewer wishing to raise their beer to the next level. But minerals in brewing water also determine specific flavor attributes. Ionic species important to beer are discussed and concepts like the sulfate to chloride ratio are explained. Examples illustrate how to tailor your brewing water to suit any style of beer. To complete the subject the authors focus on brewery operations relating to source water treatment such as the removal of particulates, dissolved solids, gas, and liquid contaminants, organic contaminants, chlorine, and chloramine, and dissolved oxygen. This section considers the pros and cons of various technologies including membrane technologies such as filtration, ion exchange systems, and reverse osmosis.
