A Platform-Centric Approach to System-on-Chip (SOC) Design Vijay Madisetti, Chonlameth Arpikanondt, 2006-06-28 Increasing system complexity has created a pressing need for better design tools and associated methodologies and languages for meeting the stringent time to market and cost constraints Platform centric and platform based system on chip SoC design methodologies based on reuse of software and hardware functionality has also gained increasing exposure and usage within the Electronic System Level ESL design communities The book proposes a new methodology for realizing platform centric design of complex systems and presents a detailed plan for its implementation The proposed plan allows component vendors system integrators and product developers to collaborate effectively and efficiently to create complex products within budget and schedule constraints This book focuses more on the use of platforms in the design of products and not on the design of platforms themselves Platform centric design is not for everyone as some may feel that it does not

allow them to differentiate their offering from competitors to a significant degree However its proponents may claim that the time market and cost advantages of platform centric design more than compensate for any drawbacks

Systems Engineering for Commercial Aircraft Scott Jackson,2020-09-10 The key principle of systems engineering is that an aircraft should be considered as a whole and not as a collection of parts Another principle is that the requirements for the aircraft and its subsystems emanate from a logical set of organized functions and from economic or

customer oriented requirements as well as the regulatory requirements for certification The resulting process promises to synthesize and validate the design of aircraft which are higher in quality better meet customer requirements and are most economical to operate This book is more of a how to and a why to rather than a what to guide It stresses systems engineering is an integrated technical managerial process that can be adapted without sacrificing quality in which risk handling and management is a major part It explains that the systems view applies to both the aircraft and the entire air transport system The book emphasizes that system engineering is not an added layer of processes on top of the existing design processes it is the glue that holds all the other processes together The readership includes the aircraft industry suppliers and regulatory communities especially technical program and procurement managers systems design and specialty engineers human factors reliability safety etc students of aeronautical and systems engineering and technical management and government agencies such as FAA and JAA

Training and Simulation Shem Malmquist, Dennis A. Vincenzi, Katherine Lemos, Shawn Pruchnicki, 2025-09-16 Developing training and simulation is a complex business From understanding human performance design usability and the limitations of training types to considerations with virtual reality VR producing realistic scenarios and even helping accident investigations leaves the practitioner with almost an overwhelming challenge However they know that their goal is to cut out developing methods that can train and test the sharp end professional to be ready for any eventuality whether in the air a chemical plant or the operating room Through chapters written by leading experts this book aims to address the key questions and concerns when developing training and simulation in high risk industries This book identifies unexplored challenges and weaknesses in the aviation domain including ground based training and flight simulation compared to the real world of in flight complex aircraft operations aviation accidents and incidents airspace and air traffic control aeronautical communications air navigation aircraft automation and pilot certification and testing These concerns are not just relevant to aviation however This book pushes beyond aviation to include other fields including petrochemical and medicine that while on the surface are different include some of the same human and organizational challenges It integrates machine challenges with human factors science and includes a view of the corporate influences on training Safety is a consideration in all the challenges and current limitations in training and simulation and the book is written with the intention of improving both training and safety as industries deal with more and more complex advanced technology Underpinned by case studies and real life examples this book will give the reader a thorough overview of the limitations of current training methods but with a view to improving and developing better methods for future training scenarios Opportunities and solutions are presented for current or future research and the application and incorporation of these in day day operations Training and Simulation Processes Challenges and Solutions will appeal to practitioners of human factors training pilots and ground operators engineers involved in systems design safety specialists test evaluators and accident investigators across multiple domains

Unsettled Topics on the Use of IVHM in the Active Control

Loop Rhonda Walthall, 2020-07-01 The growth in global economies has led to a world that has become much more mobile in the last few decades The number of enplanements has increased and is expected to continue to do so at an annual average rate of 1.8% through 2039. Prior to the COVID-19 pandemic the number of aircraft in service was expected to increase annually to meet the travel demand Next generation more complex aircraft were scheduled to replace the older aircraft at a pace that still allowed sufficient capacity to meet the increasing demand The events of 2020 have driven the industry to accelerate retirement of older aircraft while deferring the introduction of new aircraft While the length of the industry recovery period cannot be predicted most analysts believe that demand for travel will return once a vaccine is widely available The impact to the design of next generation aircraft will likely be shaped by technologies that are being accelerated for the post COVID world as well as for new mobility platforms Technologies such as artificial intelligence and fault tolerant and self adapting control will use integrated vehicle health management (IVHM) capabilities as part of the decision making processes This SAE EDGE Research Report seeks to explore the unsettled issues surrounding embedding IVHM information into the active control loops of modern aircraft systems and in future generations of aircraft designs NOTE SAE EDGE Research Reports are intended to identify and illuminate key issues in emerging but still unsettled technologies of interest to the mobility industry The goal of SAE EDGE Research Reports is to stimulate discussion and work in the hope of promoting and speeding resolution of identified issues SAE EDGE Research Reports are not intended to resolve the challenges they identify or close any topic to further scrutiny Click here to access the full SAE EDGETM Research Report portfolio <https://doi.org/10.4271/EPR2020011>
