Noah's Ravens James O. Farlow, 2018-10-08 How can the tracks of dinosaurs best be interpreted and used to reconstruct them In many Mesozoic sedimentary rock formations fossilized footprints of bipedal three toed tridactyl dinosaurs are preserved in huge numbers often with few or no skeletons Such tracks sometimes provide the only clues to the former presence of dinosaurs but their interpretation can be challenging How different in size and shape can footprints be and yet have been made by the same kind of dinosaur How similar can they be and yet have been made by different kinds of dinosaurs To what extent can tridactyl dinosaur footprints serve as proxies for the biodiversity of their makers Profusely illustrated and meticulously researched Noah's Ravens quantitatively explores a variety of approaches to interpreting the tracks carefully examining within species and across species variability in foot and footprint shape in nonavian dinosaurs and their close living relatives The results help decipher one of the world's most important assemblages of fossil dinosaur tracks found in sedimentary rocks deposited in ancient rift valleys of eastern North America Those often beautifully preserved tracks were among the first studied by paleontologists and they were initially interpreted as having been made by big birds one of which was jokingly identified as Noah's legendary raven

Smilodon Lars Werdelin, H. G. McDonald, Christopher A. Dinosaurs David E. Fastovsky, David B. Weishampel, 2021-07 Fully updated and beautifully illustrated this leading textbook teaches science and non science majors to think like a scientist

The Equids Herbert H. T. Prins, Iain J. Gordon, 2023-08-03 The narrative of the progression of the horse family through geological time from dog sized fruit eating animals with four toes on their front and three toes on their hind legs to the valiant long legged single toed modern grazing horses beloved by racing enthusiasts is the poster child of evolution However like the rhinos or tapirs the horse like zebras wild asses kulans kiangs onagers and the real horses are often portrayed as being past their evolutionary peak as compared to the more recently evolved ruminants especially bovids and deer which now dominate the grazing niche That story of a species group over its evolutionary zenith is compelling but anyone who has travelled in the remote savannas of Africa or the cold wild deserts of Central Asia is awed with herds of glorious animals that clearly do not ruminate It appears as though these so named hind gut fermenters are perhaps much better adapted to these environments than one is led to believe The purpose of this book is to dispel the myth of the inferior Equidae by describing and investigating the evolutionary and ecological journey of the horse family in all its glory
