Balance Sheet

Assets are economic resources, whereas **liabilities** and **stockholders' equity** are sources of financing for the economic resources. Liabilities are economic resource providers, whereas the financing provided by the owners of the corporation is **stockholders' equity**. Assets, liabilities, and equity are reported on the **balance sheet**, every balance sheet of a corporation is based on the following equation:

FORMULA: Assets = Liabilities + Stockholders' Equity

 **Remember:** The balance sheet formula can help when analyzing business transactions, understanding how a transaction impacts the elements of the balance sheet is fundamental to transaction analysis and the practice of accounting.

Net worth, calculated for both individuals and business entities, is a measure of wealth (the net worth formula is a derivative of the balance sheet equation).

FORMULA: Net Worth = Assets - Liabilities

EX: If you own assets worth \$750,000 and have liabilities of \$250,000, then your net worth is \$500,000 (i.e., \$750,000 - \$250,000).

 **Hint:** A corporation's organization does not have owners, the third section of the balance sheet is known as **net assets** (instead of owner's equity or stockholders' equity) in a corporation's balance sheet is represented by the following accounting equation:

FORMULA: Assets = Liabilities + Net Assets

Assets are the resources owned by the business; payment assets include cash, accounts, and notes receivable; inventory, and prepaid expenses; noncurrent assets include long-term investments, property and equipment, and intangible assets.

FORMULA: Assets = Current Assets + Noncurrent Assets

Liabilities are the obligations or claims of the business against the assets of that business; current liabilities include accounts payable, notes payable, and accrued liabilities payable; noncurrent liabilities include all long-term debts.

FORMULA: Liabilities = Current Liabilities + Noncurrent Liabilities

 **Remember:** Some have obligations that the test shows up on the balance sheet; these "off balance sheet" liabilities are additions to the balance sheet but can be influential and may seriously impact the financial health of the entity.

Equity, synonymous with net worth, is the ownership interest in a company; part of equity is contributed capital, which includes investments made by stockholders in the company's common and preferred stock; another part is retained earnings, which is the net income that has been invested in the equity since the start of its existence.

FORMULA: Stockholders' Equity = Contributed Capital + Retained Earnings

Changes in the retained earnings balance (i.e., income or decrease) can happen whenever a company is profitable (net income), is profitable and pays, or pays dividends; net income increases retained earnings and dividends, which are earnings paid to stockholders, and reduces the balance of retained earnings.

FORMULA: Change in Retained Earnings = Net Income - Dividends

 **Net income** refers to retained earnings on the prior year period adjustments for provisions of net income prior period adjustments for adjustments of net income income retained earnings.

In a partnership, the equity is called **partners' capital**, which is measured by capital contributions by partners (investments) and income and decreased when there is a net loss or when partners withdraw capital (drawings).

FORMULA: Ending Capital = Beginning Capital + Net Income (or - Net Loss) + Investment - Drawings

EX: If the beginning capital is \$200,000, net income for the year is \$50,000 with no new investments, and the owners draw out \$20,000, then the ending capital will be \$230,000 (i.e., \$200,000 + \$50,000 - \$20,000).

Income Statement & Retained Earnings

The income statement consists of formula to calculate net income or net loss; revenues are earned from the sale of goods or services to customers; whereas expenses represent the amount of resources the entity used to earn the revenues; if the revenues are greater than the expenses, then the result of the formula is a positive number (net income); if the expenses are greater than the revenues, then the result of the formula is a negative number (net loss). The income statement also known as the statement of income, statement of earnings, statement of operations, or the profit (and loss) statement (P&L) - consists the following formula:

FORMULA: Net Income (or Net Loss) = Revenues - Expenses

Net sales are the net revenue of a business; net sales take into account discounts given to customers for various reasons.

FORMULA: Net Sales = Gross Sales - Sales Discounts - Credit Card Discounts - Sales Returns and Allowances

Hint:

Gross Sales = Total sales for a period before subtracting discounts.

Sales Discounts = Discounts given because of early payment.

Credit Card Discounts = The amount charged by the credit card company (e.g., 2% of sales amount).

Sales Returns and Allowances = A reduction of sales revenue for returns or allowances for unsatisfactory goods.

EX: If gross sales are \$1,000,000 with discounts of \$100,000 granted for early payment and returns of \$20,000, then the net sales would be \$880,000 (i.e., \$1,000,000 - \$100,000 - \$20,000).

 **Net income** is an important concept, as it is the residual amount after expenses for the revenues and stockholders with corporations, income available to common stockholders is known as **retained earnings**, as it gives a more refined, accurate picture of profitability.

FORMULA: Income Available to Common Stockholders = Net Income - Dividends or Preferred Stock for the Current Period

Income statements can be prepared in various formats; one popular format is the **classified income statement**, which shows the income from operations and the net income for a particular period of time arranged as follows:

Net Sales
Cost of Goods Sold
Gross Margin
Operating Expenses
Net Operating Income
Nonoperating Revenues and/or Expenses and Gains and/or Losses
Income Before Income Taxes
Income Taxes
Net Income

The calculation of net income is really the result of several formulas, such as gross margin, net operating income, and income before taxes:

FORMULA: Gross Margin = Net Sales - Cost of Goods Sold

Net Operating Income = Gross Margin - Operating Expenses

Income Before Income Taxes = Net Operating Income + Nonoperating Revenues and/or Gains - Nonoperating Expenses and/or Losses

Net Income = Income Before Income Taxes - Income Taxes

EX: If net sales are \$750,000 and the cost of goods sold is \$200,000, then the gross margin is \$550,000 (i.e., \$750,000 - \$200,000), which must cover the operating expenses in order to break even or produce net income.

 **Gross margin** is also called **gross profit**.

Net income statement can also be prepared in the **contribution margin format**, which is useful to managers for decision-making purposes.

FORMULA: Net Income = Contribution Margin - Variable Expenses = Contribution Margin - Fixed Expenses

 **The contribution margin format** can also be used to construct a segment income statement.

FORMULA: Segment Revenue (or Sales) - Segment Variable Expenses = Contribution Margin - Segment Fixed Expenses = Segment Margin

 **Variable fixed expenses** are those expenses that not only are fixed but also can be associated with the expense with a high degree of accuracy.

 **A segment** can be a division, product, customer, or territory - that is, any part of a business that which management wants to track profitability. Since a company's operations program is its primary program that must contain various needs, it issues a statement of activities (instead of the income statement) issued by a for-profit business, which shows the ending balance of the assets.

FORMULA: Ending Net Assets = Revenues - Expenses + Beginning Net Assets

EXERCISE:

Revenues - Both things as contributions by donors, membership dues, program fees, money raised from fundraising events, grants, and investment income.

Expenses - Program expenses, which are the amounts directly incurred by the nonprofit in carrying out its program and supporting-services expenses, including management general and fundraising expenses.

 **Nonprofit and governmental agencies** produce a form of accounting that is a bit different than GAAP, whereas the annual report is the focus of for-profit companies, the budget is the government report that a nonprofit and governmental agency.

Earnings per share (EPS) is the amount of common stock earnings that can be associated with a single share of a corporation's common stock, or parity with a single capital structure (only common stock outstanding) has basic earnings per share (EPS).

FORMULA: EPS =
$$\frac{\text{Income Available to Common Stockholders}}{\text{Weighted-Average Number of Common Shares Outstanding}}$$

principles involved in a problem that leads to many possible different solution methods To prescribe a set of rules for each of the possible variations would involve an enormous number of additional steps making this task more burdensome than solving the problem directly due to the expectation of much trial and error Current textbooks normally explain a given principle in a few pages written by an accounting professional who has insight into the subject matter not shared by others These explanations are often written in an abstract manner that causes confusion as to the principle's use and application Explanations then are often not sufficiently detailed or extensive enough to make the reader aware of the wide range of applications and different aspects of the principle being studied The numerous possible variations of principles and their applications are usually not discussed and it is left to the reader to discover this while doing exercises Accordingly the average student is expected to rediscover that which has long been established and practiced but not always published or adequately explained The examples typically following the explanation of a topic are too few in number and too simple to enable the student to obtain a thorough grasp of the involved principles The explanations do not provide sufficient basis to solve problems that may be assigned for homework or given on examinations Poorly solved examples such as these can be presented in abbreviated form which leaves out much explanatory material between steps and as a result requires the reader to figure out the missing information This leaves the reader with an impression that the problems and even the subject are hard to learn completely the opposite of what an example is supposed to do Poor examples are often worded in a confusing or obscure way They might not state the nature of the problem or they present a solution which appears to have no direct relation to the problem These problems usually offer an overly general discussion never revealing how or what is to be solved Many examples do not include accompanying diagrams or graphs denying the reader the exposure necessary for drawing good diagrams and graphs Such practice only strengthens understanding by simplifying and organizing accounting processes Students can learn the subject only by doing the exercises themselves and reviewing them in class obtaining experience in applying the principles with their different ramifications In doing the exercises by themselves students find that they are required to devote considerable more time to accounting than to other subjects because they are uncertain with regard to the selection and application of the theorems and principles involved It is also often necessary for students to discover those tricks not revealed in their texts or review books that make it possible to solve problems easily Students must usually resort to methods of trial and error to discover these tricks therefore finding out that they may sometimes spend several hours to solve a single problem When reviewing the exercises in classrooms instructors usually request students to take turns in writing solutions on the boards and explaining them to the class Students often find it difficult to explain in a manner that holds the interest of the class and enables the remaining students to follow the material written on the boards The remaining students in the class are thus too occupied with copying the material off the boards to follow the professor's explanations This book is intended to aid students in accounting overcome the difficulties described by supplying detailed illustrations of

the solution methods that are usually not apparent to students Solution methods are illustrated by problems that have been selected from those most often assigned for class work and given on examinations The problems are arranged in order of complexity to enable students to learn and understand a particular topic by reviewing the problems in sequence The problems are illustrated with detailed step by step explanations to save the students large amounts of time that is often needed to fill in the gaps that are usually found between steps of illustrations in textbooks or review outline books The staff of REA considers accounting a subject that is best learned by allowing students to view the methods of analysis and solution techniques This learning approach is similar to that practiced in various scientific laboratories particularly in the medical fields In using this book students may review and study the illustrated problems at their own pace students are not limited to the time such problems receive in the classroom When students want to look up a particular type of problem and solution they can readily locate it in the book by referring to the index that has been extensively prepared It is also possible to locate a particular type of problem by glancing at just the material within the boxed portions Each problem is numbered and surrounded by a heavy black border for speedy identification
