BIOMES

Take a closer look at the images above. Each is home to a variety of plants and animals, but no two are the same. Although they're all capable to life, there are quite a lot of differences too. Many of these differences are **abiotic**, or have to do with the non-living parts of the environment. Abiotic factors include temperature, the amount of oxygen in the air or water, and the kind of soil present.

infer, or make your best guess, about some of the abiotic factors in each of the images.

extremely nutrient rich soil. Here you'll find a variety of plants and animals. Due to their dry and hot climate, plants in both savanna and grasslands are adapted to survive relatively common fires.

Desert

When we think of deserts, we usually think of a hot and dry place, but did you know that deserts can be cold too? The Gobi Desert in Asia is the largest cold desert in the world. It's cold there, but there is so little rain (or snow) that it's still considered a desert. Both plants and animals must adapt to dry life in the desert. Many animals, such as water storage, or the ability to remain dormant (similar to hibernation) for a long time.

Forest

There are several different kinds of forest biomes, including: The rainforest is most likely the most famous forest. This lush biome has an average of 1000 cm (400 inches) of rainfall. Rainforests are home to a vast number of plants and animals, and it's nearly impossible to find in this abundant ecosystem. Here you can find parrots, sloths, and many more.

The temperate forest is common in the US, Canada, Europe, and Asia. Here you'll find deciduous trees that lose their leaves in the winter. In fact, that's what this biome is famous for. It's a unique biome, and it's nearly impossible to find in this abundant ecosystem. Here you can find bears, deer, and many more.

The boreal forest is a cold forest with cone-bearing, coniferous trees. It's found in Northern Canada and Russia. The days are long in the summer and short in the winter due to the latitude of these forests, so they're home to a variety of animals.

BIOMES

Earth is an amazing planet. It has many different environments that make perfect homes for millions of species. The largest major habitats that exist worldwide are known as **biomes**. Most likely, you're familiar with many of these: desert, rainforest, grassland, etc. Each biome is unique and has its own set of characteristics that make it different from the others. One of the most important factors in maintaining biodiversity, or the amazing variety of life, that makes our Earth so abundant in species and resources.

How many biomes are there? Do all water environments constitute a single aquatic biome? Are all fire-filled ecosystems considered a forest biome? The number of biomes you could simply depend on how specific you'd like to be. Let's take a look at some of the largest biomes, and the abiotic and biotic factors that define them.

Aquatic Biomes
Since water covers over 70% of the Earth, the largest biomes are the aquatic biomes. Marine biomes include coral reefs and estuaries, but the two major ones are the marine and freshwater biomes.

The marine biome, made up of the world's oceans, is so big it's nearly impossible to describe. Estimates of its size range from 1.3 billion to 1.4 billion square kilometers. The sheer size of the ocean creates ocean currents which play a major role in creating weather.

Smaller freshwater biomes consist of lakes, ponds, and rivers. These are often part of the marine biomes because they do not contain salt. Freshwater biomes are especially important to us humans as they provide the water that we use to drink. All aquatic biomes provide homes for diverse plant and animal life.

Grassland
Grassland biomes live up to their name! They're made up of open and very few trees. The two major grassland biomes are the savanna and temperate grassland.

The savanna is a biome that covers half of Africa and large parts of Australia. These areas have a 6-8 month wet season in the summer and a 4-6 month dry season. Elephants, giraffes, and many other animals live in the savanna.

The temperate grasslands, on the other hand, make up the plains of middle America. They're home to a variety of animals, including bison, cattle, and many other species.

BIOMES

Answer the following questions using the world map.

1. What is a biome?
2. Is weather a biotic factor or an abiotic factor? How do you know?

could find in a marine ecosystem.

marine and freshwater ecosystems.

it **adapt** (or change) to survive. For example, polar bears have to keep their bodies warm in their cold environment. What animals need to survive in the desert?

the biome including the plants, animals, and landforms.
