Biome Assessment Study Guide

Biomes: A place characterized by the organisms that live there and determined by the abiotic factors of rainfall and temperature.

A biome can be aquatic (water) or terrestrial (land) and contain one or more ecosystems.

Land Biomes

Temperate deciduous forest- soil is fairly rich and plants cover the forest floor

- most trees are deciduous, losing their leaves in the fall to help conserve water so they can survive winter.

Coniferous/Taiga forest- conifer trees that produce their seeds in cones and do not lose their leaves in fall

- trees conserve water in the winter with the help of needlelike leaves and a waxy coating on their leaves

Tropical rainforests - receive the highest yearly average rainfall

- most biologically diverse (the most different types of plants and animals)
- soil is wet and has poor nutrients

Savanna- large herbivores live and graze on the grass here, scattered clumps of trees

Temperate grasslands have small, wind-tolerant, perennial deep-rooted grasses.

Deserts receive very little water or rainfall, vegetation is sparse.

- animals are adapted to survive with little water.

Tundra is a cold, treeless landscape with low-growing vegetation.

- permafrost prevents roots from growing, which is why small plants survive.
