Interphase → duplication of DNA + organelles

PMAT = Prophase Metaphase Anaphase Telophase

Mitosis - asexual nuclear division

|           |                                                                                   |                                                                                                      |
|-----------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| Prophase  |  | Nuclear envelope breaks, chromatin condense, centrosomes separate, formation of mitotic spindle      |
| Metaphase |  | DNA lines up at Metaphase Plate due to mitotic spindle pulling on sister chromatids via kinetochores |
| Anaphase  |  | Centrosomes push out, microtubules shorten, sister chromatids separate                               |
| Telophase |  | Nuc envelope reforms, chromosomes decondense, mitotic spindle breaks                                 |

Cytokinesis - cell division → 2 identical daughter cells

homologs: equivalent chromosome from mother + father  
diploid - DNA from both parents haploid - from 1 parent chromatid

Meiosis - Sexual Nuclear Division → 4 haploid gametes

|             |                                                                                   |                                                                                               |
|-------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| Prophase I  |  | Nuc envelope breaks, centrosomes separate, spindle fibers form crossing over between homologs |
| Metaphase I |  | Homologs line up at metaphase plate spindle fibers attached to kinetochores                   |
| Anaphase I  |  | Homologs pulled apart but sister chromatids are still attached                                |
| Telophase I |  | Nuc envelope reforms around sister chromatids. Cytokinesis happens at the same time           |

Meiosis I Product: 2 haploid daughter cells with duplicate DNA. (double mothers or fathers DNA)

|              |                                                                                     |                                                                                     |                                                                                                       |
|--------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Prophase II  |    |    | Nuc envelope breaks, centrosomes separate, spindle fibers form No crossing over                       |
| Metaphase II |   |   | Sister chromatids line up at metaphase plate (90° plate turn)                                         |
| Anaphase II  |  |  | Cohesin breaks, sister chromatids pulled apart                                                        |
| Telophase II |  |  | Nuc envelope reforms around haploid chromatids which decondense to chromatin cytokinesis at same time |

Product Meiosis II: 4 haploid gametes

Spermatogenesis → 4 spermatids  
oogenesis → 1 ootid + 2 (or 3) polar bodies

|                  |               |                                                    |
