The Central Nervous System

The *Central Nervous System* is made up of the **brain and spinal cord**.

The brain's role is to **receive, integrate, and process** information sent from all around the body, and **generate responses** to it.

The spinal cord is made up of an **intricate and delicate cable of fibres** running from the base of the brain to the lower back. It connects the brain to the rest of the body via its connection to the peripheral nervous system.

The spinal cord is protected by a ring of bone known as the **vertebrae**.

You will find grey and white matter if you cut into the spinal cord.

- Grey matter is made up of **cell bodies, their axons, and their dendrites**.
- White matter is made up of **entirely myelin-coated axons**.

The Peripheral Nervous System

The *peripheral nervous system* is the **nerves outside of the brain and spinal cord**. It has two functions.

1. To communicate information from the **organs, muscles, and glands** to the central nervous system from both the **outside world** (environmental temperature and sensation on the skin via the sensory neuron) and the **inside world** (such as aches and pains).
2. To communicate information from the CNS to the body's **organs, muscles, and glands** (via motor neurons).

The neurons that transmit information **towards** the brain are called **sensory/afferent** neurons.

The neurons that transmit information **away from** the brain are called **motor/efferent** neurons.

The peripheral nervous system has two subdivisions; the **somatic nervous system** and the **autonomic nervous system**.
