Biokinetics And Biodynamics Of Human Differentiation Principles And Applications:

Biokinetics and Biodynamics of Human Differentiation Erich Blechschmidt, M.D., R.F. Gasser, Ph.D., 2012-05-15 Fifty years ago the field of human embryology was incomplete prior to that time the anatomy of early human embryos was still unknown and there was much to be learned about the older stages of human embryonic development It is now understood that human organs result from step by step differentiations of the growing human embryo Research by renowned embryologist Erich Blechschmidt MD showed that differentiations are not only the result of a gene effect but are also brought about through growth initiated by extragenetic occurring outside the gene information Without this extragenetic information the differentiation would not begin Dr Blechschmidt and coauthor Raymond Gasser PhD maintain that Haeckel's biogenetic law ontogeny recapitulates phylogeny was an erroneous attempt to explain developmental processes Blechschmidt's human embryological investigations showed that Darwin's principles mutation and selection are likely valid for the origin of the species but that they cannot explain the ontogenesis of the organs The ontogenesis of each individual cannot be derived from phylogenetic facts The authors stress that a clear distinction must be made between the vast field of phylogenetics and the much more exact and understandable field of ontogenetics particularly the process of differentiation and their goal is to present not only the abstract biokinetic principles of differentiation but the originality of embryonic human beings as well Their knowledge of developmental movements leads to their conclusion that differentiation is an undivided biodynamic process that occurs during development and includes the chemical processes as well Logically organized into two sections the first covers early metabolic fields and includes chapters on the one cell human ovum the early embryo blood vessels the nervous system head region trunk and limbs the second describes metabolic fields in later developmental stages distinguishing fields of corrosion densation contusion distension retention dilation liquation and detracton Biokinetics and Biodynamics of Human Differentiation warrants reading by thoughtful professionals in a number of fields concerned with embryonic differentiation A new preface by Dr Gasser addresses how the book's principles and findings were and are understood in the field of human embryology

The Ontogenetic Basis of Human Anatomy Erich Blechschmidt, M.D., 2004-07-12 This book presents an anatomical overview of the changing form and structure of the human body Although biomechanical embryology can be traced back to the 19th century up until recently the most commonly accepted framework for the study of human ontogeny development of the individual was molecular biology which all too frequently relied on findings from animal experiments that remained untested for humans German embryologist and anatomist Erich Blechschmidt's research concentrates on the evidence presented by the human embryo itself He offers a new approach to the study of early human growth as a way to shed light on the development of body build instincts gestures language mathematics tools and dress
