

Chapter 9

Choice and Preference

Study Questions:

1. How do behavior analysts define the following: (1) choice and (2) preference?
 - Behavior analysts define choice as "the distribution of operant behavior among alternative sources of reinforcement. When several options are available, one alternative may be selected more frequently than others" (Cheney & Pierce, 2017, p. 291). Preference is "when several schedules of reinforcement are available concurrently, one alternative may be chosen more frequently than others. When this occurs, we say that the organism shows the preference for that alternative" (Cheney & Pierce, 2017, p. 523). They go hand in hand, choice of a preferred activity.
2. What is a concurrent schedule of reinforcement?
 - A reinforcement procedure in which the participant can choose to respond on one of two or more simple reinforcement schedules that are available simultaneously.
3. Why are concurrent ratio schedules not typically used to study choice behavior?
 - Concurrent ratio schedules are not typically used to study choice behavior because they usually result in 'exclusive preference', or the highest pay off. It is not possible to study how responses in alternatives. Thus, the book says to use other schedules to investigate choice.
4. How does steady-state performance on concurrent fixed-interval (FI) schedules differ from concurrent VI schedules?
 - A steady state performance is a stable pattern of responding. A fixed schedule has a record of a stable pattern of responding compared to variable. VI is the time between a reinforcer is varied. "Because the organism is unable to discriminate the time to reinforcement of VI schedules, the regular switching pattern that characterizes concurrent FI performances on both alternatives as switching does not always result in reinforcement" (Cheney & Pierce, 2017, p. 294). VIVI is used to stabilize operant behavior.
5. Why is a COD an important and necessary feature of concurrent choice procedures?
 - The changeover delay, or COD, stipulates that responses have no effect immediately following a change from one schedule to another. The COD prevents frequent switching between alternatives and minimizes concurrent superstition—the inadvertent strengthening of the changeover response.
6. What did Herrnstein's proportional matching equation say about the distribution of responses across concurrent choices?
 - He studied two-key concurrent schedule on pigeons (A & B). He focused in on the rate of response, expressed as a proportion. It studied to which point would a person choose one or the other. Concurrent schedule looks at A or B and which
