Applied Probability Springer Texts In Statistics:

Applied Probability Kenneth Lange, 2010-08-13 Applied Probability presents a unique blend of theory and applications with special emphasis on mathematical modeling computational techniques and examples from the biological sciences It can serve as a textbook for graduate students in applied mathematics biostatistics computational biology computer science physics and statistics Readers should have a working knowledge of multivariate calculus linear algebra ordinary differential equations and elementary probability theory Chapter 1 reviews elementary probability and provides a brief survey of relevant results from measure theory Chapter 2 is an extended essay on calculating expectations Chapter 3 deals with probabilistic applications of convexity inequalities and optimization theory Chapters 4 and 5 touch on combinatorics and combinatorial optimization Chapters 6 through 11 present core material on stochastic processes If supplemented with appropriate sections from Chapters 1 and 2 there is sufficient material for a traditional semester long course in stochastic processes covering the basics of Poisson processes Markov chains branching processes martingales and diffusion processes The second edition adds two new chapters on asymptotic and numerical methods and an appendix that separates some of the more delicate mathematical theory from the steady flow of examples in the main text Besides the two new chapters the second edition includes a more extensive list of exercises many additions to the exposition of combinatorics new material on rates of convergence to equilibrium in reversible Markov chains a discussion of basic reproduction numbers in population modeling and better coverage of Brownian motion Because many chapters are nearly self contained mathematical scientists from a variety of backgrounds will find Applied Probability useful as a reference

Applied Probability {Springer Texts in Statistics} Kenneth Lange, 2003 Includes applications of probability to a wide range of fields this book should be of particular interest to graduate students and researchers in the life sciences

Applied Probability and Statistics Mario Lefebvre, 2006-05-04 This book moves systematically through the topic of applied probability from an introductory chapter to such topics as random variables and vectors stochastic processes estimation testing and regression The topics are well chosen and the presentation is enriched by many examples from real life Each chapter concludes with many original solved and unsolved problems and hundreds of multiple choice questions enabling those unfamiliar with the topics to master them Additionally appealing are historical notes on the mathematicians mentioned throughout and a useful bibliography A distinguishing character of the book is its thorough and succinct handling of the varied topics

Introduction to Rare Event Simulation James Bucklew, 2004-03-11 This book is an attempt to present a unified theory of rare event simulation and the variance reduction technique known as importance sampling from the point of view of the probabilistic theory of large deviations This framework allows us to view a vast assortment of simulation problems from a single unified perspective It gives a great deal of insight into the fundamental nature of rare event simulation Unfortunately this area has a reputation among simulation practitioners of requiring a great deal of technical and probabilistic expertise In this text I have tried to

keep the mathematical preliminaries to a minimum the only prerequisite is a single large deviation theorem dealing with sequences of R^d valued random variables This theorem and a proof are given in the text Large deviation theory is a burgeoning area of probability theory and many of the results in it can be applied to simulation problems Rather than try to be as complete as possible in the exposition of all possible aspects of the available theory I have tried to concentrate on demonstrating the methodology and the principal ideas in a fairly simple setting Madison Wisconsin 2003 James Antonio Bucklew Contents 1 Random Number Generation 1 1 1 Uniform Generators 1 1 2 Nonuniform Generation 8 1 2 1 The Inversion Method 8 1 2 2 The Acceptance Rejection Method 10 1 3 Discrete Distributions 13 1 3 1 Inversion by Truncation of a Continuous Analog 14 1 3 2 Acceptance Rejection 15

Optimization Kenneth Lange, 2013-03-09 Finite dimensional optimization problems occur throughout the mathematical sciences The majority of these problems cannot be solved analytically This introduction to optimization attempts to strike a balance between presentation of mathematical theory and development of numerical algorithms Building on students skills in calculus and linear algebra the text provides a rigorous exposition without undue abstraction Its stress on convexity serves as bridge between linear and nonlinear programming and makes it possible to give a modern exposition of linear programming based on the interior point method rather than the simplex method The emphasis on statistical applications will be especially appealing to graduate students of statistics and biostatistics The intended audience also includes graduate students in applied mathematics computational biology computer science economics and physics as well as upper division undergraduate majors in mathematics who want to see rigorous mathematics combined with real applications Chapter 1 reviews classical methods for the exact solution of optimization problems Chapters 2 and 3 summarize relevant concepts from mathematical analysis Chapter 4 presents the Karush Kuhn Tucker conditions for optimal points in constrained nonlinear programming Chapter 5 discusses convexity and its implications in optimization Chapters 6 and 7 introduce the MM and the EM algorithms widely used in statistics Chapters 8 and 9 discuss Newton's method and its offshoots quasi Newton algorithms and the method of conjugate gradients Chapter 10 summarizes convergence results and Chapter 11 briefly surveys convex programming duality and Dykstra's algorithm From the reviews An excellent imaginative and authoritative text on the difficult topic of modeling the problems of multivariate outcomes with different scaling levels different units of analysis and different study designs simultaneously Biometrics March 2005 As a textbook *Optimization* does provide a valuable introduction to an important branch of applicable mathematics Technometrics August 2005 I found *Optimization* to be an extremely engaging textbook the text is ideal for graduate students or researchers beginning research on optimization problems in statistics There is little doubt that someone who worked through the text as part of a reading course or specialized graduate seminar would benefit greatly from the author's perspective Journal of the American Statistical Association December 2005

[Introduction to Time Series and Forecasting](#) Peter J. Brockwell, Richard A. Davis, 2002-03-08 This is an introduction to time series that emphasizes methods and analysis of

data sets The logic and tools of model building for stationary and non stationary time series are developed and numerous exercises many of which make use of the included computer package provide the reader with ample opportunity to develop skills Statisticians and students will learn the latest methods in time series and forecasting along with modern computational models and algorithms

Long-Range Dependence and Self-Similarity Vlasov Pipiras, Murad S. Taqqu, 2017-04-18 This modern and comprehensive guide to long range dependence and self similarity starts with rigorous coverage of the basics then moves on to cover more specialized up to date topics central to current research These topics concern but are not limited to physical models that give rise to long range dependence and self similarity central and non central limit theorems for long range dependent series and the limiting Hermite processes fractional Brownian motion and its stochastic calculus several celebrated decompositions of fractional Brownian motion multidimensional models for long range dependence and self similarity and maximum likelihood estimation methods for long range dependent time series Designed for graduate students and researchers each chapter of the book is supplemented by numerous exercises some designed to test the reader's understanding while others invite the reader to consider some of the open research problems in the field today
