Gass,Carl M. Harris,2001 Audience Anyone concerned with the science techniques and ideas of how decisions are made BOOK JACKET The Design of Aircraft Landing Gear Robert Kyle Schmidt,2021-02-18 The aircraft landing gear and its associated systems represent a compelling design challenge simultaneously a system a structure and a machine it supports the aircraft on the ground absorbs landing and braking energy permits maneuvering and retracts to minimize aircraft drag Yet as it is not required during flight it also represents dead weight and significant effort must be made to minimize its total mass The Design of Aircraft Landing Gear written by R Kyle Schmidt PE B A Sc Mechanical Engineering M Sc Safety and Aircraft Accident Investigation Chairman of the SAE A 5 Committee on Aircraft Landing Gear is designed to guide the reader through the key principles of landing system design and to provide additional references when available Many problems which must be confronted have already been addressed by others in the past but the information is not known or shared leading to the observation that there are few new problems but many new people The Design of Aircraft Landing Gear is intended to share much of the existing information and provide avenues for further exploration The design of an aircraft and its associated systems including the landing system involves iterative loops as the impact of each modification

to a system or component is evaluated against the whole. It is rare to find that the lightest possible landing gear represents the best solution for the aircraft; the lightest landing gear may require attachment structures which don't exist and which would require significant weight and compromise on the part of the airframe structure design. With those requirements and compromises in mind, *The Design of Aircraft Landing Gear* starts with the study of airfield compatibility, aircraft stability on the ground, the correct choice of tires, followed by discussion of brakes, wheels and brake control systems. Various landing gear architectures are investigated together with the details of shock absorber designs. Retraction kinematics and mechanisms are studied as well as possible actuation approaches. Detailed information on the various hydraulic and electric services commonly found on aircraft and system elements such as dressings, lighting and steering are also reviewed. Detail design points the process of analysis and a review of the relevant requirements and regulations round out the book content. *The Design of Aircraft Landing Gear* is a landmark work in the industry and a must read for any engineer interested in updating specific skills and students preparing for an exciting career.

*Handbook of Human Factors and Ergonomics*  
 Gavriel Salvendy, 1997-05-12. In orchestrating this book, Dr. Salvendy invited contributions from more than 100 of the foremost authorities around the world. Each of its 60 chapters was reviewed by an international advisory panel comprised of some of today's leading figures in human factors and ergonomics. While each chapter establishes the theoretical and empirical foundations of the subject under discussion, the book's approach is primarily applications oriented. Hence, throughout, readers will find case studies, examples, figures and tables that optimize the usability of the material presented. It is an indispensable tool for human factors and ergonomics specialists, safety and industrial hygiene professionals and engineers, human resource professionals and managers in manufacturing and service industries and for educational institutions and government.

**BOOK JACKET**     **AIR CRASH INVESTIGATIONS: EYE OF THE NEEDLE** *The Crash of British Airways Flight 38* Hans Griffioen, editor, 2012-11-01. On 28 November 2008, a Boeing 777-200ER operated by British Airways as flight BA38 on its way from Beijing, China to London Heathrow, suffered on approach to Heathrow Airport an in-flight engine rollback. At 720 feet agl, the right engine ceased responding to autothrottle commands for increased power and instead the power reduced to 1.03 Engine Pressure Ratio (EPR). Seven seconds later, the left engine power reduced to 1.02 EPR. This reduction led to a loss of airspeed and the aircraft touching down some 330 m short of the paved surface of Runway 27L at London Heathrow. The investigation identified that the reduction in thrust was due to restricted fuel flow to both engines. It was determined that the restriction occurred most probably in the Fuel Oil Heat Exchangers. The investigation identified the forming of ice in the fuel system as probable cause. The aircraft was destroyed but there were no casualties.
