approaches in many phases of flight safety management from proactive assessment of potential risks of flights before taking off to automatic analysis of occurred flight events for commercial airlines. Flight safety is commonly the core value of airlines. Serious flight disasters always bring tremendous impacts and losses to the industry and the society; thus airlines and the authorities always treat the issues of flight safety management as the first priority. It presents the information systems that assist the safety staff and managers to adopt preventive operations or to analyze the critical factors or operations that cause a flight event. Such information systems were developed based on artificial intelligence and quantitative approaches including fuzzy logic expert systems, deep learning, decision making methods, reliability theory, and data mining. After introducing the flight safety management practice and common programs as well as basic artificial intelligence and quantitative approaches, the book describes in detail the information systems we have developed and provides instructions for flight safety practitioners to implement such information systems in their organizations. Case studies collected from the cooperated airline are also presented.
