NeutroAlgebras as Generalizations of Classical Algebras Smarandache, Florentin, Al-Tahan, Madeline, 2022-04-15

Neutrosophy is a new branch of philosophy that studies the origin nature and scope of neutralities as well as their interactions with different ideational spectra In all classical algebraic structures the law of compositions on a given set are well defined but this is a restrictive case because there are situations in science where a law of composition defined on a set may be only partially defined and partially undefined which we call NeutroDefined or totally undefined which we call AntiDefined Theory and Applications of NeutroAlgebras as Generalizations of Classical Algebra introduces NeutroAlgebra an emerging field of research This book provides a comprehensive collection of original work related to NeutroAlgebra and covers topics such as image retrieval mathematical morphology and NeutroAlgebraic structure It is an essential resource for philosophers mathematicians researchers educators and students of higher education and academicians **Symmetry in**

Classical and Fuzzy Algebraic Hypercompositional Structures Irina Cristea, 2020-05-29 This book is a collection of 12 innovative research papers in the field of hypercompositional algebra 7 of them being more theoretically oriented with the other 5 presenting strong applicative aspects in engineering control theory artificial intelligence and graph theory Hypercompositional algebra is now a well established branch of abstract algebra dealing with structures endowed with multi valued operations also called hyperoperations having a set as the result of the interrelation between two elements of the support set The theoretical papers in this book are principally related to three main topics semi hypergroups hyperfields and BCK algebra Heidari and Cristea present a natural generalization of breakable semigroups defining the breakable semihypergroups where every non empty subset is a subsemihypergroup Using the fundamental relation on a hypergroup some new properties of the classes are obtained by De Salvo et al who introduced and investigated the notion of height of a class Based on the properties of a cyclic hypergroup of particular matrices Krehlik and Vyroubalova describe the symmetry of lower and upper approximations in certain rough sets connected with this hypergroup These results suggest an application to

the study of detection sensors In the framework of hyperrings and hyperfields theory a new line of research has been developed regarding hyperhomomorphisms on Krasner hyperfields with interesting applications in cryptography Vahedi et al and new fuzzy weak hyperideals were defined in Hv rings by using the concept of fuzzy multiset Al Tahan et al for which some algebraic properties were obtained Two articles are dedicated to the study of BCK algebras Bordbar et al present the properties of the relative annihilator in lower BCK semilattices whereas several types of intuitionistic fuzzy soft ideals in hyper BCK algebras were defined and studied by Xin et al Increasing numbers of researchers are interested in the applicative aspects of algebraic hypercompositional structures For example new properties related with symmetric relations are emphasized by Chvalina and Smetana for the structures and hyperstructures of artificial neurons Novak et al present a mathematical model based on elements of algebraic hyperstructure theory used in the context of underwater wireless sensor networks A construction of granular structures using m polar fuzzy hypergraphs and level hypergraphs is illustrated in Luqman et al using examples from a real life problem In the last paper in this book Akram et al discuss some properties related to edge regularity for q rung picture fuzzy graphs
