

up the motion observed in a Slinky on spring after
 in which the medium vibrates perpendicular to the
 and a longitudinal wave is a wave in which the medium
 direction the wave travels.

mediums have higher energy, so waves in the higher energy have
 the same wavelength.

mediums the number of complete cycles in a given time. There are
 waves travel through a medium, so it has the greater frequency

wavelength, the less often a wave crest will cross a specific point. The
 higher wavelengths have lower frequencies, while shorter wavelengths have
 higher frequencies, and frequency is inversely proportional to wavelength.

in water is a longitudinal wave. When sound waves travel in air, for example,
 motion, parallel to the motion of the wave.

mediums should not add sound to the sound that vibrates in the sound
 medium, the vibrations would have nothing through which to travel. Thus, they can
 not travel. As a result, there would be no sound.

with waves have to try to be 100°C because at normal temperatures, the air
 cannot support sound waves and molecules are vibrating faster. Thus, sound waves in
 air travel faster, too, because the atoms and molecules bump into each other more &
 transfer energy.

is traveling faster than that. I believe the speed of sound in water is 1,500
 meters. You are much faster than the sound waves in water, which causes the
 pile up and form a high compression wave called a shock wave. When the air
 reaches your ear, you hear a very loud sound.

Large-amplitude sound waves have greater intensity and are much louder
 amplitude sound waves.

In the ear, every increase of 10 dB is the same as a 10-fold increase in
 the sound wave. So first, find the difference in intensity, and then find the
 number of times larger it is.

Step 1: Intensity of soft whisper = 15 dB
 Intensity of loud restaurant = 75 dB
 How many times larger = ?

Step 2: This doesn't need to use any equations, just subtraction.
 Intensity of loud restaurant - intensity of soft whisper
 Subtract the numbers from step 1 and solve.

Step 3 & 4: $75 \text{ dB} - 15 \text{ dB} = 60 \text{ dB}$

Step 5: The loud restaurant is 60 dB louder than a soft whisper. Since each 10 dB
 represents a 10-fold increase in sound wave intensity, we need to
 determine how many factors of 10 we need by dividing 60 by 10 to get 6.
 So, the total increase is calculated by taking 10 and multiplying it by itself
 6 times.

$10 \times 10 \times 10 \times 10 \times 10 \times 10 = 1,000,000$ times larger

The reason the intensity of the loud restaurant's sound waves is 1,000,000 times larger
 than the intensity of a soft whisper's sound waves.

Sound waves with low pitch have low frequencies and long wavelengths.
 As the pitch grows away from you, the sound waves the loudspeaker produce get
 further and further apart. This makes the wavelengths seem longer to your ears, which
 all results in a lower frequency. Thus, the loudspeaker's pitch is lower, which also means it
 has longer wavelengths.
