A Survey Of Statistical Network Models A Survey Of Statistical Network Models:

A Survey of Statistical Network Models Anna Goldenberg, Alice X. Zheng, Stephen E. Fienberg, Edoardo M. Airolidi, 2010
Networks are ubiquitous in science and have become a focal point for discussion in everyday life. Formal statistical models for the analysis of network data have emerged as a major topic of interest in diverse areas of study and most of these involve a form of graphical representation. Probability models on graphs date back to 1959. Along with empirical studies in social psychology and sociology from the 1960s, these early works generated an active network community and a substantial literature in the 1970s. This effort moved into the statistical literature in the late 1970s and 1980s and the past decade has seen a burgeoning network literature in statistical physics and computer science. The growth of the World Wide Web and the emergence of online networking communities such as Facebook, MySpace and LinkedIn and a host of more specialized professional network communities has intensified interest in the study of networks and network data. Our goal in this review is to provide the reader with an entry point to this burgeoning literature. We begin with an overview of the historical development of statistical network modeling and then we introduce a number of examples that have been studied in the network literature. Our subsequent discussion focuses on a number of prominent static and dynamic network models and their interconnections. We emphasize formal model descriptions and pay special attention to the interpretation of parameters and their estimation. We end with a description of some open problems and challenges for machine learning and statistics.

Network Models for Data Science Alan Julian Izenman, 2023-01-05
This text on the theory and applications of network science is aimed at beginning graduate students in statistics, data science, computer science, machine learning and mathematics as well as advanced students in business, computational biology, physics, social science and engineering working with large complex relational data sets. It provides an exciting array of analysis tools including probability models, graph theory and computational algorithms, exposing students to ways of thinking about types of data that are different from typical statistical data. Concepts are demonstrated in the context of real applications such as relationships between financial institutions, between genes or proteins, between neurons in the brain and between terrorist groups. Methods and models described in detail include random graph models, percolation processes, methods for sampling from huge networks, network partitioning and community detection. In addition to static networks, the book introduces dynamic networks such as epidemics where time is an important component.

Handbook of Econometrics, 2020-11-25
Handbook of Econometrics Volume 7A examines recent advances in foundational issues and hot topics within econometrics such as inference for moment inequalities and estimation of high dimensional models. With its world class editors and contributors, it succeeds in unifying leading studies of economic models, mathematical statistics and economic data. Our flourishing ability to address empirical problems in economics by using economic theory and statistical methods has driven the field of econometrics to unimaginable places. By designing methods of inference from data based on models of human choice behavior and social

César Ducruet, 2015-10-05 Maritime transport is one of the most ancient supports to human interactions across history and it still supports more than 90% of world trade volumes today The changing connectivity of maritime networks is of crucial importance to port transport and economic development and planning The way ports terminals but also cities regions and countries are connected with each other through maritime flows is not well known and difficult to represent and measure even for the transport actors themselves There is a strong urgent need for reviewing the relevant theories concepts methods and sources that can be mobilized for the analysis of maritime networks With contributions from reputable scholars from all over the world this book investigates the analysis of maritime flows and networks from diverse disciplinary angles going across archaeology history geography regional science economics mathematics physics and computer sciences Based on a vast array of methods such as Geographical Information Systems GIS spatial analysis complex networks modelling and simulation it addresses several crucial issues related with port hierarchy route density modal interdependency network robustness and vulnerability traffic concentration and seasonality technological change and urban regional economic development This book examines new evidence about how socio economic trends are reflected but also influenced by maritime flows and networks and about the way this knowledge can support and enhance decision making in relation to the development of ports supply chains and transport networks in general This book is an ideal companion to anyone interested in the network analysis of transport systems and economic systems in general as well as the effective ways to analyse large datasets to answer complex issues in transportation and socio economic development **Applied Statistics for Network**

Biology Matthias Dehmer, Frank Emmert-Streib, Armin Graber, Armino Salvador, 2011-04-08 The book introduces to the reader a number of cutting edge statistical methods which can be used for the analysis of genomic proteomic and metabolomic data sets In particular in the field of systems biology researchers are trying to analyze as many data as possible in a given biological system such as a cell or an organ The appropriate statistical evaluation of these large scale data is critical for the correct interpretation and different experimental approaches require different approaches for the statistical analysis of these data This book is written by biostatisticians and mathematicians but aimed as a valuable guide for the experimental researcher as well computational biologists who often lack an appropriate background in statistical analysis
