Groshong, 2006-07-09 Geological structures are three dimensional yet are typically represented by and

terpreted from outcrop maps and structure contour maps both of which are curved two dimensional surfaces Maps plus serial sections called 2 D provide a closer approach to three dimensionality Computer technology now makes it possible for geological interpretations to be developed from the beginning in a fully three dimensional environment Fully 3 D geological models allow significantly better interpretations and interpretations that are much easier to share with other geologists and with the general public This book provides an overview of techniques for constructing structural interpretations in 2 D 2 D and 3 D environments for interpolating between and extrapolating beyond the control points and for validating the final interpretation The underlying philosophy is that structures are three dimensional solid bodies and that data from throughout the structure whether in 2 D or 3 D format should be integrated into an internally consistent 3 D interpretation It is assumed that most users of this book will do their work on a computer Consequently the book provides quantitative structural methods and techniques that are designed for use with spreadsheets mapping software and three dimensional computer graphics programs The book is also intended to provide the background for understanding what interpretive software for example a computer contouring program does automatically Most techniques are presented in both a traditional format appropriate for paper pencil and a pocket calculator and in quantitative format for use with spreadsheets and computer graphics or computer aided design programs
