Antibodies Cheng Liu, John Morrow, 2017 **A Practical Guide to Drug Development in Academia** Daria Mochly-Rosen, Kevin Grimes, 2014-07-08 A lot of hard won knowledge is laid out here in a brief but informative way Every topic is well referenced with citations from both the primary literature and relevant resources from the internet Review from Nature Chemical Biology Written by the founders of the SPARK program at Stanford University this book is a practical guide designed for professors students and clinicians at academic research institutions who are interested in learning more about the drug development process and how to help their discoveries become the novel drugs of the future Often many potentially transformative basic science discoveries are not pursued because they are deemed too early to attract industry interest There are simple relatively cost effective things that academic researchers can do to advance their findings to the point that they can be tested in the clinic or attract more industry interest Each chapter broadly discusses an important topic in drug development from preclinical work in assay design through clinical trial design regulatory issues and marketing assessments After the practical overview provided here the reader is encouraged to consult more detailed texts on specific topics of interest I would actually welcome it if this book s intended audience were broadened even more Younger scientists starting out in the drug industry would benefit from reading it and getting some early exposure to parts of the process that they ll eventually have to understand Journalists covering the industry especially the small startup companies will find this book a good reality check for many an over hopeful press release Even advanced investors who might want to know what really happens in the labs will find information here that might otherwise be difficult to track down in such a concentrated form

Talwar, 2012-12-06

Once again we have gathered to discover and evaluate advances made in our ability to understand, diagnose, and possibly treat breast cancer with the new reagents provided by monoclonal antibody techniques. In the last two years since our first International Workshop on Monoclonal Antibodies and Breast Cancer, there has been an enormous surge in the number and quality of applications for these new reagents. Solid achievements have been made in identification and quantitation of estrogen and progesterone receptors in histopathological diagnostic procedures, in serum diagnosis, and we are witnessing now the first attempts to treat breast cancer with immunoconjugates. Cytosolic estrogen receptors can now be quantitated with monoclonal antibodies, and also their cellular distribution can be directly assessed histologically. In addition, monoclonal antibodies to progesterone receptors have been generated that show promise in having similar uses as those to the estrogen receptor. In the field of diagnosis, the use of monoclonal antibodies has permitted the development of serological approaches for early diagnosis by identifying and measuring breast epithelial antigens in serum, and of histological approaches for establishing criteria for breast cancer dissemination and prognosis. With great expectations, we are all following developments in the area of breast cancer treatment using conjugates of anti-breast epithelial monoclonal antibodies, which are now confirming earlier reports in affecting breast tumor control. The recent creation of newer monoclonal antibodies and conjugates await experimentation and clinical trials to determine their value.
