Atmosphere Ocean And Climate Dynamics Volume 40 An Introductory Text International Geophysics:

Atmosphere, Ocean and Climate Dynamics John Marshall, R. Alan Plumb, 2007-12-19 For advanced undergraduate and beginning graduate students in atmospheric oceanic and climate science Atmosphere Ocean and Climate Dynamics is an introductory textbook on the circulations of the atmosphere and ocean and their interaction with an emphasis on global scales It will give students a good grasp of what the atmosphere and oceans look like on the large scale and why they look that way The role of the oceans in climate and paleoclimate is also discussed The combination of observations theory and accompanying illustrative laboratory experiments sets this text apart by making it accessible to students with no prior training in meteorology or oceanography Written at a mathematical level that is appealing for undergraduates and beginning graduate students Provides a useful educational tool through a combination of observations and laboratory demonstrations which can be viewed over the web Contains instructions on how to reproduce the simple but informative laboratory experiments Includes copious problems with sample answers to help students learn the material

Climate of the Past, Present and Future Javier Vinós, 2022-09-20 This book is an unorthodox ground breaking scientific study on natural climate change and its contribution to ongoing multi centennial global warming The book critically reviews the effect of the following on climate Milankovitch cycles abrupt glacial Dansgaard Oeschger events Holocene climate variability the 1500 year cycle solar activity volcanic eruptions greenhouse gases energy transport Applying the scientific method to available evidence reveals that some of these phenomena are profoundly misunderstood by most researchers Milankovitch cycles are tied to orbital obliquity not to orbital precessional summer insolation glacial megatides might have triggered abrupt Dansgaard Oeschger events and tides are likely responsible for the related 1500 year climate cycle Climate change affects volcanic eruptions more than the opposite and secular variations in solar activity are more important to climate change during the Holocene than greenhouse gases In this book we see how important natural climate change has been on human societies of the past It also produces new climate projections for the 21st century and when the next glaciation could happen What emerges from this study of natural climate change is a central theme Variations in the transport of energy from the tropics to the poles have been neglected as a cause of climate change and solar activity variations affect climate by modulating this transport The author tells us Transporting more energy from a greenhouse gas rich region the tropics to a greenhouse gas poor region the poles increases the amount of energy lost at the top of the atmosphere The effect resembles a reduction in the greenhouse gas content The book presents the Winter Gatekeeper Hypothesis on how variations in solar activity regulate Earth's energy transport and in so doing affect atmospheric circulation the rotation of the planet and the El Niño Southern Oscillation This book is oriented toward students and academics in the climate sciences and climate anthropology and should also appeal to readers interested in the science of natural climate change The repercussions of Climate of the Past Present and Future are far reaching By uncovering a strong natural climate change component it provides a novel view of

anthropogenic climate change fossil energy use and our future climate a view quite different from the IPCC's gloomy projections

Atmosphere, Ocean and Climate Dynamics John Marshall, R. Perspectives on the Age of the Earth and Why They Matter Francis Ö. Dudás, 2020-02-13 Polls show almost half of US adults believe that Earth is only 10 000 years old whereas scientists consider our planet to be 4 56 billion years old Examining these conflicting views illuminates aspects of the perceived conflict between religion and science and helps us understand the battles between evolutionist and creationist advocates This book examines how we approach knowledge and how we look at certainty It disentangles the threads of the traditional knowledge we are taught from the knowledge we gain from our own investigation of truth It argues that nature the basis of science and scripture the basis of religion derive from a single source Because of their shared origins religious and scientific perspectives grounded in verifiable truths must be in harmony The book presents the science behind the reliability of isotopic dates and critiques young earth creationist attacks on isotopic studies Though the nature of time is a philosophical issue its measurement is a scientific venture that has affirmed that Earth is 4 56 billion years old The harmony of science and religion based on recognition of their single source is a prerequisite for the progress of humanity as a whole

History, Change and Sustainability Detlev Möller, 2020-03-09

Climate change is a major challenge facing modern society The chemistry of air and its influence on the climate system forms the main focus of this book Vol 2 of Chemistry of the Climate System takes a problem based approach to presenting global atmospheric processes evaluating the effects of changing air compositions as well as possibilities for interference with these processes through the use of chemistry
