to a system or component is evaluated against the whole. It is rare to find that the lightest possible landing gear represents the best solution for the aircraft; the lightest landing gear may require attachment structures which don't exist and which would require significant weight and compromise on the part of the airframe structure design. With those requirements and compromises in mind, *The Design of Aircraft Landing Gear* starts with the study of airfield compatibility, aircraft stability on the ground, the correct choice of tires, followed by discussion of brakes, wheels and brake control systems. Various landing gear architectures are investigated together with the details of shock absorber designs. Retraction kinematics and mechanisms are studied as well as possible actuation approaches. Detailed information on the various hydraulic and electric services commonly found on aircraft and system elements such as dressings, lighting and steering are also reviewed. Detail design points the process of analysis and a review of the relevant requirements and regulations round out the book content. *The Design of Aircraft Landing Gear* is a landmark work in the industry and a must read for any engineer interested in updating specific skills and students preparing for an exciting career.

AIR CRASH INVESTIGATIONS: EYE OF THE NEEDLE
The Crash of British Airways Flight 38
Hans Griffioen, editor, 2012-11-01

On 28 November 2008, a Boeing 777-200ER operated by British Airways as flight BA38 on its way from Beijing, China to London Heathrow, suffered on approach to Heathrow Airport an in-flight engine rollback. At 720 feet agl, the right engine ceased responding to autothrottle commands for increased power and instead the power reduced to 1.03 Engine Pressure Ratio (EPR). Seven seconds later, the left engine power reduced to 1.02 EPR. This reduction led to a loss of airspeed and the aircraft touching down some 330 m short of the paved surface of Runway 27L at London Heathrow. The investigation identified that the reduction in thrust was due to restricted fuel flow to both engines. It was determined that the restriction occurred most probably in the Fuel Oil Heat Exchangers. The investigation identified the forming of ice in the fuel system as the probable cause. The aircraft was destroyed but there were no casualties.
