Atlas Of Nevada Conifers A Phytogeographic Reference:

Atlas of Nevada Conifers David Alan Charlet, 1996 Atlas of Nevada Conifers is a major scientific contribution to our understanding of the ecology of Nevada. It documents in great detail the distribution of all native conifer species in the state, critical information because of the primary ecological importance of conifers for all organisms and because of the lack of documentation of these distributions in the scientific literature before now. Charlet maps and documents the exact location of herbarium records for 1 600 individual trees. The data found in 23 tables and 22 range maps will serve as a primary reference for botanists, land managers, and conservation biologists for years to come. Conifers Aljos Farjon, 1999 Conifers are one of the world's most important resources of timber. If managed wisely and used sustainably, these resources will provide wood for a multitude of purposes virtually indefinitely. Additional products include resins and their derivatives and even medicinal extracts, for example, taxol, now used in the treatment of cancer. Conifers occur on all continents except Antarctica. Of the 630 species, 355 are listed as of conservation concern, with 200 or 25 of species threatened with extinction. Although exploitation of these resources is as old as civilization, this century has seen a dramatic increase in the exploitation of timber resources. This action plan assesses conifer diversity and its threats. It is unique among IUCN's Plant Action Plans so far published in that it gives the complete global red list of conifers using the 1994 IUCN Red List Categories and criteria. Data is analyzed to identify conifer hot spots where conservation should be a priority and a short list of threatened species is prioritized. The North American Forests Laurence C. Walker, 2023-07-28 The North American Forests: Geography, Ecology, and Silviculture describes where, why, and how the many kinds of trees found on this continent grow in silvical associations called forest cover types. Thirteen chapters describe more than 100 forest cover types involving several times that many species. Diverse woodlands discussed include: o The Arctic tundra o Florida's tropics o The Atlantic's coastal pond pines o The Pacific's Monterey pines o The summits of Englemann spruce o Sea Level swamps of baldcypress. The text acts as a singular guidebook for specialists and students in natural resource disciplines, examining the geography, ecology, and silvicultural practices for sustaining North American forests; students in curriculum's involving regional silviculture; and persons examining the goods and services from this varied, fascinating renewable resource. Benefiting from the author's five decades of practicing forestry, the reader will trek into virtually every neck of the woods, perusing exceptional field notes and photographs of the continent's forests. Features: o Offers a summary of forests in North America, ecological positions, and best management approaches for the benefit of mankind o Contains a readable language for both college students and professionals o Provides information covering the forests of Canada and the US o Lists Further Readings and Subjects for Discussion and Essay at the end of each chapter o Includes more than 100 photographs. Audience: o Foresters o Ecologists o Natural Resource Managers o Forestry Students **Proceedings RMRS.**, 1998 **Proceedings**, 1999 **Mapping And Imagination In The Great Basin** Richard V. Francaviglia, 2005-03-07 The Great Basin was the last region of continental

North America to be explored and mapped and it remained largely a mystery to Euro Americans until well into the nineteenth century In Mapping and Imagination in the Great Basin geographer historian Richard Francaviglia shows how the Great Basin gradually emerged from its cartographic silence as terra incognita and how this fascinating process both paralleled the development of the sciences of surveying geology hydrology and cartography and reflected the changing geopolitical aspirations of the European colonial powers and the United States Francaviglia s interdisciplinary account of the mapping of the Great Basin combines a chronicle of the exploration of the region with a history of the art and science of cartography and of the political economic and cultural contexts in which maps are created It also offers a compelling wide ranging discussion that combines a description of the daunting physical realities of the Great Basin with a cogent examination of the ways humans from early Native Americans to nineteenth century surveyors to twentieth century highway and air travelers have understood defined and organized this space psychologically and through the medium of maps Mapping and Imagination in the Great Basin continues Francaviglia s insightful richly nuanced meditation on the Great Basin landscape that began in Believing in Place

The Great Basin Donald Grayson, 2011-04-18 The Great Basin centering on Nevada and including substantial parts of California Oregon and Utah gets its name from the fact that none of its rivers or streams flow to the sea This book synthesizes the past 25 000 years of the natural history of this vast region It explores the extinct animals that lived in the Great Basin during the Ice Age and recounts the rise and fall of the massive Ice Age lakes that existed here It explains why trees once grew 13 beneath what is now the surface of Lake Tahoe explores the nearly two dozen Great Basin mountain ranges that once held substantial glaciers and tells the remarkable story of how pinyon pine came to cover some 17 000 000 acres of the Great Basin in the relatively recent past These discussions culminate with the impressive history of the prehistoric people of the Great Basin a history that shows how human societies dealt with nearly 13 000 years of climate change on this often challenging landscape Provided by publisher
