Soil-structure interaction in seismic analysis Alexander Tyapin, 2019-06-11 Soil structure interaction SSI is an important phenomenon in the seismic response analysis As seismologists describe seismic excitation in terms of the seismic motion of certain control point at the free surface of the initial site the question is whether the same point of the structure after

structure appears will have the same seismic response motion in case of the same seismic event If yes then seismic motion from seismologists is directly applied to the base of the structure it is called fixed base analysis and they say that no SSI occurs though literally speaking soil is forcing structure to move so interaction is always present This is a conventional approach in the field of civil engineering However if heavy and rigid structure sometimes embedded is erected on medium or soft soil site this structure changes the seismic response motion of the soil as compared to the initial free field picture Such a situation is typical for Nuclear Power Plants NPPs deeply embedded structures etc The book describes different approaches to SSI analysis and different SSI effects Special attention is paid to the Combined Asymptotic Method CAM developed by the author and used for the design of NPPs in seismic regions Nowadays some civil structures have parameters comparable to those of NPPs e g masses and embedment so these approaches become useful for the civil structural engineers as well
